But if certain buildings are to be classed as failures when considered as examples of mechanical ventilation, and a source of mirth to those who unthinkingly exult over the mistakes and misfortunes that are bound to attend upon science experimentally applied, there still remains the question whether the blame attaches to the principle or to its faulty application to a special case. In designing the County Hall ventilation scheme, for instance, the complaints which had been raised concerning certain details of the mechanical ventilation schemes at the Houses of Parliament and the Central Criminal Court were carefully considered, yet in the new building a mechanical scheme was used after all which embodied some variations on the former installations. These, in their turn, are being made the subject of criticism and abuse in some quarters, but time has hardly been allowed for a thorough test of their efficiency. No system is perfect, and under the conditions in force some hundreds of years ago the atmosphere of our Courts of Justice is reported to have been not only nauseating but deadly, since anyone attending a trial ran a severe risk of becoming infected with gaol fever, "a contagious distemper occasioned by confinement and close air." Critics of modern methods do not seem to mince matters either, and, since gaol fever is no longer available in England, they make excellent play with what verbal ammunition they can obtain from among the ailments more fashionable at the moment, accusing extreme forms of mechanical ventilation with the production of "lassitude and headache," and with probable complications such as "pleurisy, pneumonia and peritonitis." Every detail seems to be made the subject of contention, and while some authorities commend mechanical movement of the air as beneficial, even where the vitiated air is not expelled and replaced by new arrangements by which air that has been previously warmed or cooled is projected into contact with human beings, they are now meeting with expressions of disapproval from responsible medical men on both sides of the Atlantic.

Putting aside the somewhat remote chances of catching either gaol fever or peritonitis, the habit of living in a close artificially heated atmosphere has the inevitable disadvantage that severe discomfort is involved whenever the person so habituated is deprived of the means of maintaining himself within his favourite conditions.

Adaptability to changes of climate and of weather is a quality which the white man, and particularly the Briton, possesses in a high degree, and a system of ventilation which tends to deprive him of this valuable heritage in the interests of comfort, or even in the interests of increased efficiency for short periods, is to looked upon as pernicious in the long run.

A middle course can be found between crudities of the so-called "hardening proce in which individuals are encouraged to extremes of temperature without adequate tection, and the "warmth and comfort at price school," which devitalises in the run just as surely, if not so instantaneously, the other.

Much more scientific attention might directed to the homely side of ventilation that the designer of a house would be able provide by foresight that the rooms should free from draughts, that the flues should and fires burn without wasting half their in the form of soot—matters of immense imp ance to the householder, his family and to neighbours, but depending at present very m more upon good luck than good management.

Continuous application to both theory practice in another branch of sanitary scie has provided us with rationally designed d pipes and with efficient administrative con in respect to laying and testing them. same combination of intelligence and experim applied to ventilation will end by showing how to admit fresh air to a room with inviting a large proportion of filthy soot, how to warm it without discharging soot to detriment of our neighbours. And, if the sides of the problem are solved together, need for elaborate air washing and filte installations may be eliminated.

THE BIRMINGHAM GAS EXHIBITION.

SMOKE ABATEMENT.

To pass from the clean and pure air of the countryside into the murky, smoke-laden atmosphere of an industrial town is one of the most depressing experiences of the traveller, and is more noticeable when seen from the window of a railway carriage. The trees give way to factory chimneys. Cottages kept clean by the rain are followed by buildings which the smoke-belching chimneys have coated with an unlovely garment of soot and grime, which the rain, polluted from the same source, fails to wash away and only succeeds in making worse. The ever-changing beauties of the sky are almost unknown to the town dweller: a canopy of smoke hangs over all.

Collateral with the formation of these industrial areas was the erection of large areas of what soon degenerated into slums. Unhealthy dwellings appear to be part of the price we pay for our position as an industrial nation, and it is a debatable point how far the smoke which makes these towns so gloomy to live in darkens the people's outlook on life and deadens the desire for a better condition of things. It is certainly strange that the smoke evil has been tolerated so long, for it is only within recent years that any determined effort has been made to deal with it.

This smoky blight has been proved to be costing millions of pounds per annum by its decaying effect on buildings alone, while the amount of disease it causes and its toll of human life can hardly be estimated. In its worst form it has been checked by legislation prohibiting the emission of black smoke from factories, railway engines, &c., and the development of other forms of heat from industrial and domestic purposes during the past few years has been of great assistance to those who in the interests of the general public have been pressing for the abolition of the smoke nuisance. That smoke is not a necessary adjunct to industrialism is proved by the case of Pittsburg, which, formerly one of the most smoke-ridden cities in the world, now has the atmosphere of a country town. This remarkable improvement has been brought about by stringent legislation forbidding the use of soft coal, and the inhabitants have not only gained in having a better town to live in, but the manufacturers rapidly recouped the expense of adapting their works to the new conditions by increased efficiency on the part of the workers.

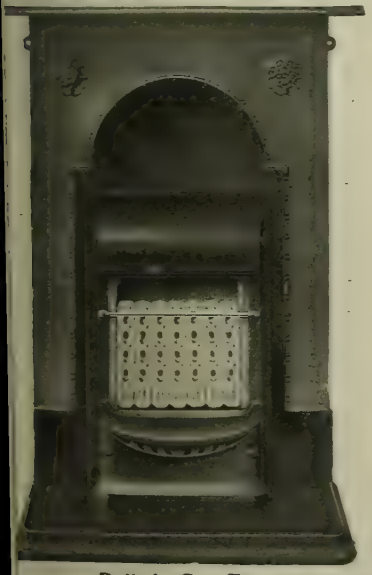
It is now recognised that domestic fires contribute quite as much to the smoke evil as factories; but while any attempt to convert existing coal-burning grates to consume their own smoke, or to burn smokeless fuel, would undoubtedly fail, much may be done by popularising the alternative methods of heating and cooking. The gas and electricity undertakings, and the manufacturers of fires, cookers, geysers, &c., are doing much to make the advantages of these smokeless methods better realised, and the increasing extent to which they are being adopted is the measure of their success.

The National Gas Exhibition now being held at Bingley Hall, Birmingham, and which remains open until October 3, is an excellent example of what can be done in this direction. The exhibition is under the patronage of H.M. the King, and has the support of the National Gas Council, the Institution of Gas Engineers, the British Commercial Gas Association, the Society of British Gas Industries, the Gas Companies' Protection Association, the Midland Association of Gas Engineers and Managers, the various District Gas Associations, and the leading Corporation Gas Committees and Boards of Gas Companies. It is under the control of an Executive Committee representing the Midland Commercial Gas Association, and has for its President the Rt. Hon. the Lord Mayor of Birmingham (Alderman Sir David Davis, J.P.).

At this Exhibition are demonstrated the convenience and cleanliness and other advantages of the "all-gas" house. And although these advantages were formerly mostly appreciated by those who found difficulty in obtaining domestic assistance, the increasing adoption of gas fires, coppers and geysers in the housing schemes of local authorities, is bringing these labour-saving devices before the notice of those who probably most need them—the working classes. At the exhibition the apparatus shown ranges from elaborate schemes of a large central geyser supplying hot water to all parts of the house for heating by radiators as well as for other purposes, to simple and inexpensive fires, cookers, and hot-water apparatus specially designed for cottage property.

Some of the gangways are brilliantly illuminated by lamps supplied by Messrs. James Keith & Blackman Co., Ltd., of Farringdon-avenue, E.C. These are of 1,500 and 1,000 c.p. each, and are served with ga the increased pressure of 3 lb. per sq. by this means they are giving an efficienc 60 c.p. per cubic ft. of gas.

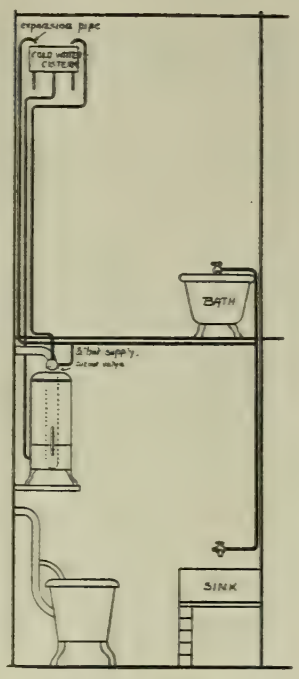
The Stands.



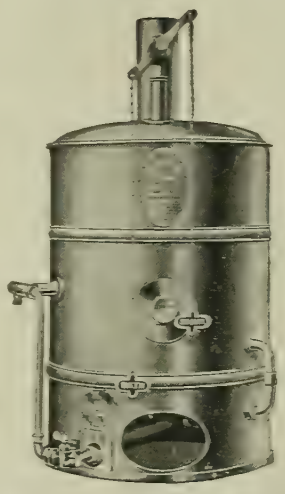
The City of Birmingham Gas Departm has two stands, one of which exhibits san of gasworks' by-products, including small burned in an anthracite stove without possibility of explosion, while the othe devoted to a working model of a new furnace.

This new type of high-efficiency furnace has an inside working chambe 4 ft. 6 in. long by 2 ft. 6 in. wide by 18 in. working with town's gas at the ordinary mingham main pressure with a natural dra It has been developed by Messrs. Gil Brothers, Ltd., in conjunction with the I trial Research Laboratories, with the obje producing a heating plant of a high th efficiency, especially in the larger sizes h hearth areas of from 3 ft. by 2 ft. up to by 5 ft. The construction follows closel lines of existing large type producer gas furnaces, and includes a special type of cou current regenerator applying to both gas air supplies. The gas is admitted in through specially-designed ports, and mee total supply of heated air in a combu chamber under the furnace hearth. The ing gases pass into the furnace chamber then through suitably arranged outlet po the waste gas flues of the regenerator. waste gas flues are independently controll dampers which provide a simple and effe means of regulating the end-to-end tempe of the furnace. Temperature control is en by wheel valves to each gas port, and atmos control by separate air slides at the top regenerator, communicating direct with gas port. By these means it is a simple n to obtain either an oxidising or reducing a phere in the furnace chamber. Recent carried out on a furnace 4 ft. 8 in. by 2 ft. by 18 in. show a thermal efficiency of 3 cent. under normal working conditions dealing with charges of 10 cwts. in weigh

The British Commercial Gas Associat



nonstrating a series of effective designs for
showrooms.
The products of Messrs. Sidney Flavel & Co.,
d., of Leamington, are now well known, and
se shown here embody some new improve-
nts. In their new cooker a novel form of
ner is introduced with the object or solving
problem of the use of highly efficient and,
refore, high temperature flame in the
king of thick or viscid foodstuff. In the
arrangement by the touch of a lever the
ner may be depressed so that flame contact
prevented when viscid food is involved, yet
fficient heat can be maintained to meet all
uirements. At the recent Royal Sanitary
titute Congress, at Hull, a silver medal
awarded for this cooker. Attention is
called to a cooker with two ovens, the
al hot-plate, and a hot closet with sliding
s door, all the metal work except that on
hot-plate being of rustless steel.
The chief exhibit of Messrs. Ewart & Son, Ltd.,
Euston-road, N.W. 1, is their "B" pattern
alifont," which furnishes an independent
ply of hot water wherever required. This
be fitted in any part of the house, and
vides hot water to any number of taps. The
perature of the hot water may be regulated
vill. The hot water continues to run as long
he tap is left open and the closing of the hot
er draw-off tap instantly lowers the gas to a
t light. There is considerable saving of gas
he gas only burns fully alight while the water
ctually running into the vessel in which it is
ired. For bath purposes only this firm is
wing the "Lightning" geyser, which is fixed
r one of their cast-iron porcelain enamelled
hs, and the "Elite," which is arranged with a
wer. Bath heaters of the geyser type are also
wn. For cafés and hotels, where there is a
and for a boiler which will give rapid
plies of boiling water, freshly boiled, for tea
coffee making, the "Ever Ready" boiler
xhibited. The merit of this boiler is that
water is boiled as required, *i.e.*, cold water
rs the apparatus and boiling water leaves it.
er exhibits on this stand include a geyser for
with lavatory basins and sinks, a gas copper
which the pan is made from one sheet of
al without a seam or joint, a gas-heated
n-cupboard heater, and a gas-heated towel



ome apparatus of special interest to those
cerned with housing schemes or small
perty is exhibited by the Parkinson Stove
Ltd., of Stechford, Birmingham, whose
lucts have been installed in some thousands
tate-aided housing schemes. The "built-in"
ire (illustrated herewith) has been extensively

Built in Gas Fire.

on the London County Council's housing
at Becontree. It is specially designed for
new houses, where the cost of erection may
duced and space gained by the elimination

"New Cottage" Water Heater.

of chimney breasts. The height is 38 in., and the width 23¾ in.; the shelf is 28½ in. wide by 5¼ in. deep. The base measures 11 in. from back to front. The fire and hearth are finished art black, and the surround and shelf primed only. The fire takes five or seven radiants. The "Liverpool" series of gas cookers, such as are being supplied for the Liverpool Corporation's new houses, are also exhibited. These are supplied in two designs. The larger size measures 34 in. high on stand, and has an oven door opening 14 in. wide by 16 in. high and a hot plate 20½ in. wide by 17 in. deep. The smaller size has a height (on stand) of 34 in., the cooker itself having a hot plate 20 in. wide by 17 in. deep and a door opening 14 in. wide by 10 in. high. Another interesting exhibit on this stand is the sealed pattern "New Cottage" water heater (illustrated above), which has also been largely adopted on the Becontree estate. This heater is made in non-rusting copper, and no galvanised iron fittings are used. It supplies hot water either above or below its own level. A separate expansion pipe from the cylinder prevents the accumulation of steam when the cut-out valve is closed, or the expansion pipe may have the connection to the hot-water taps taken off at one or more branches. The illustration shows a heater for supplying bath and sink, and, as will be seen, by the manipulation of a chain-operated valve either the bath or sink may be supplied.

The "Hurry" Water Heater Co., of 39, Broad-street, Birmingham, are showing their well-known cylinders, furnaces, and bath heaters. These are supplied in sizes to meet all requirements. This firm's 10-gallon cylinder has been adopted for the Nottingham Corporation's housing schemes, and many others.

Messrs. James Stott & Co., of Vernon Works, Oldham, are making a special feature of their coffee-making machine, which has several novel features. The coffee grains are first scalded and their pores opened, then the extraction or expressing of the essence takes place. The machine is fool-proof and economical, convenient to use, and automatic in operation. After lighting the pilot burner, putting in the coffee grains and filling the boiler with water, the machine does the rest, no further attention being required except when a fresh infusion is desired. There is no gas to shut off, no steam tap to turn when boiling, and no filling tap to operate. The action of filling with water automatically turns on the gas before infusion, and the process of displacing the water automatically turns the gas off after infusion. An automatic operation is also set up which is the means of dispensing with the necessity for a water filling tap. Immediately the water boils infusion commences automatically. The apparatus forms a complete and self-contained appliance for both making coffee and holding it economically in bulk ready for use, and should be of considerable interest to hotel and restaurant proprietors. Water heaters and urns specially designed for use in cafés are also shown by this firm.

Messrs. Evered & Co., Ltd., of Surrey Works, Smethwick, are exhibiting a large range of lighting fittings and other specialities, including the "Everite" lighting service burners and fittings, which are equally applicable to street lighting, the lighting of public buildings, and domestic use.

Messrs. R. & A. Main, Ltd., of Falkirk, are showing a new type of gas fire which has a close resemblance to a coal fire. This fire is designed to fit into any fireplace by simply removing the front bars of the existing grate. The resemblance to a coal fire is obtained by a separate "mat" of black cokette strung together with wire, and laid over the radiants. A representative selection of fires, cookers, grillers, hot-plates, &c., is also to be seen on this stand.

It is estimated that by the use of automatic devices of lighting and extinguishing street lamps, such as those shown by the Horstmann Gear Co., Ltd., of Newbridge, Bath, a saving of over 70 per cent. may be saved on this head. The simplest type of this firm's "Newbridge" controller requires winding fortnightly, and it is so made that the winding, time-setting, and the adjustment of the times of lighting and extinguishing are independent of one another, and can be operated and adjusted without disturbing the other elements.

A selection of attractive fires is shown by Messrs. General Gas Appliances, Ltd., of Guide Bridge, Manchester; these are made in a variety of finishes. A new type of treble-tube loop radiator embodying some new features, and a range of gas cookers, are also shown by this firm.

A representative range of the "Radiation" pattern standard gas grates as manufactured by the six firms comprising Radiations, Ltd., *i.e.*—Arden Hill & Co., the Davis Gas Stove Co., Ltd., Fletcher, Russell & Co. Ltd., Wilsons & Mathiesons, Ltd., and John Wright & Co.—is shown. All of these fires have the "Radiation" standard patent injector-ventilator, which changes the air of the room up to six times an hour. The "Radiation" patent "Thermo-XX" radiants used in all these gas grates are a distinct advance on the old pattern, inasmuch as the loose top piece is dispensed with, and the design assures more efficient combustion, with consequently greater heating power. All working parts of these grates are interchangeable, size for size, among all the "Radiation" firms, which makes for economy in maintenance. The fires are shown in many attractive designs, specially noticeable

being the "Sunbeam," which has a remarkable resemblance to a coal fire. This firm has a separate stand for the demonstration of cookers. Particular attention is drawn to the "Regulo" automatic oven heat controller, which has been introduced for the first time in the "New World" self-controlled cooker. By its use the temperature of the oven can be set at a certain figure, and it will be automatically maintained under all conditions throughout the cooking of the food. A "time-chart" is provided, which sets out the requisite times and settings for all classes of cookery. The latest model of this cooker, in which the oven is placed on one side and the hotplate on the other, with a rack underneath for pans, &c., is also shown.

The Midland Gas & Water Fittings Co., of 181, Aston-road, Birmingham, are making a special feature of "Hosler's" Midland heater, which is designed to provide and maintain a constant supply of hot water at a low cost.

A new material for piping is shown by the Non-Corrosible Pipe Co. (the British Uralite and Cellactite Works), of Higham, near Gravesend. This firm is making all kinds and sizes of gas piping, bends, flues, down-draught preventers, and other accessories and fittings, in asbestos-cement. Besides cheapness in first cost, the chief advantage claimed for this material is that it does not require painting, and this results in lower maintenance cost. The material is claimed to be gas-tight but at the same time absorbent, thus preventing condensation.

In addition to their patent burners, the Etna Lighting & Heating Co., Ltd., of 295, Broad-street, Birmingham, are showing their economical factory lamp, which automatically superheats the gas and has a consumption of only 3 ft. of gas (low pressure) per hour for a 150 candle-power lamp.

A screw with a square-headed recess in the head, in place of the usual groove, is shown by the Rawlplug Co., Ltd., of Gloucester House, Cromwell-road, London, S.W. 7. A special screwdriver is supplied for fixing these screws, which may thus be driven with one hand only; they should be specially useful for fixing to ceilings or other overhead work. The well-known "Rawlplug" outfits, for fixing to brick, tile, or other hard substances, are demonstrated, and the stand also contains some aluminium towel-rails and bathroom fittings.

The above notes on some of the more representative stands give a general outline of the nature of the exhibits. The show is of considerable interest, and should be seen by all interested in the smoke abatement movement or in the planning of convenient and labour-saving homes.

BOOK REVIEW.

The Construction of a House. By CHARLES GOURLAY, B.Sc. (Glasgow University), F.R.I.B.A., Professor of Architecture and Building in the Royal Technical College, Glasgow. Second edition, revised. (London: B. T. Batsford, Ltd. 1922. Price 7s. 6d.)

Professor Gourlay's book should be of great value to students of building construction in that the forty plates which illustrate the methods of house building and joinery all refer to the same scheme, and each detail can be studied in relation to the whole. A large mansion standing on an open site near a stream has been chosen as the subject and stone as its material, the character of the work being such as would be seen in the country surrounding a large Scottish city. Economy has not been made a first consideration in the design, but the usual complement of features, both external and internal, are shown in order that their construction may be elucidated in the sheets allotted to detailing them.

Modern building construction is most complex, and a set of plates designed in illustration of its normal practices inevitably departs somewhat from ideal simplicity. Professor Gourlay must be congratulated on having found accommodation for a great many typical details without doing violence to his theme or departing from the style suitable for execution in small stone masonry. As he writes in his Preface: "Although the several parts of the house itself have been adopted largely in order to bring together a number of constructive features, yet the external grouping of the whole house has been kept in view with the object of maintaining the unity of the design."

Students are warned that copying alone will not make them masters of their subject. The plates should be used as a basis for the student's own design, which will be the more instructive to him if it differs from the pattern, provided that he works it out consistently in plan section, elevation and details. Apart from the unavoidable diversity in the matter of features, the house is distinctly of a practicable order, and is compactly arranged with passages of only moderate length. Those on the ground floor are arranged to afford pleasant effects of light and shade by windows in their sides, not at their ends, and all are capable of good natural ventilation. Each plate is briefly described in the letterpress, and the student is forewarned of many difficulties that occur in practice. More might have been said in the text concerning the question of aspect, which has, in fact, been admirably worked out in the design. Bedrooms receive the morning sun, larders are screened from the heat, and hall and vestibule are placed where they act as buffers to the north wind. These essential elements of architecture too seldom receive adequate attention, and it is a pleasure to recognise them in an excellent and moderately priced text-book.

RUBBER FLOORS AND RUBBER ROADWAYS.

THE first meeting of the session of the Institution of the Rubber Industry was held on September 17 at the Engineers' Club, Coventry-street, Piccadilly, when a paper was read by Mr. Evan J. Edwards entitled "Rubber Floors and Rubber Roadways." The chair was taken by Mr. Francis Hooper, F.R.I.B.A., Vice-Chairman of the Standing Science Committee of the Royal Institute of British Architects.

The Chairman stated that architects' daily problems are both economic and social, their aim being to employ the most suitable materials in the varied undertakings entrusted to them. This trust precludes the employment of untested materials for obvious reasons. Their duties concern the wise outlay of the capital of others, and they can embark therefore upon no experiments without their full concurrence. The Standing Science Committee of the Royal Institute of British Architects have for some months past been considering the subject of architectural acoustics, which may be considerably affected by the employment of rubber for flooring and wall surfaces.

Mr. Edwards dealt with the second part of his subject first. The question of rubber roadways at the present time is attracting a great deal of interest. We, as a nation, are frequently told that we are behind the times, and we let other countries get in front of us, but rubber roadways are a good example of British enterprise, it being admitted that we are the only nation which has seriously considered this problem. The first rubber roadway ever to be constructed was invented by Mr. Morland M. Dessau, and this was in 1913 in Southwark, at the junction of the New and Old Kent-roads. The construction employed in this case was the mounting of a Yarrah wood block, 3 in. wide by 8 in. in length, with a pure plantation rubber facing ½ in. thick. Probably we have all been very much interested during the last week or two in seeing rubber blocks laid round the Cenotaph in Whitehall. In this case a smooth concrete surface has been prepared, and on this hot pitch has been spread just prior to laying the rubber. The rubber blocks are constructed with a groove one side and a corresponding projection on the other, so that when laid they are really mortised and tenoned into position. Before being laid each block is dipped in hot pitch. Rubber roadways constructed by a different method have been laid in Glasgow and Edinburgh during the present year. In these cases a rubber block measuring 9 in. by 4½ in. by 2 in. thick, is fixed by means of an embedded steel spike into a concrete base block of slightly smaller dimensions.

Mr. Edwards' personal opinion is that the greatest point in favour of rubber roadways will be proved to be economy, *i.e., ultimate* economy. It is the only road material which will absorb and distribute the weight of the traffic carried. Other materials by their non-resilience immediately transmit the loads to the foundations of the roads. Before leaving this subject, mention must be made of the fact that large slabs of rubber were laid a good many years ago at the entrances to both St. Pancras and Euston Stations and elsewhere, though as these were under cover the results obtained are not of very great use when considering ordinary road work. The rubber pavement in Princes-street, Edinburgh, was down for over twenty years, and each year it must have been walked upon by many millions of people, yet it was found to have lost only a fraction of an inch in thick ness during that period.

Turning now to floors, rubber as a flooring for interiors has been known and used for many years, and has abundantly justified the claim that it is absolutely the best and most economical flooring in existence. During recent years a great development has taken place and in public buildings as well as in many private houses rubber has supplanted marble, mosaic, parquet, carpet, linoleum and other floor coverings. The different types of rubber floorings may be roughly classified into four. Interlocking tiling, as its name implies, consists of separate tiles which interlock, each one being kept in position by the others. The second form is solid tiles, not interlocking, but owing to difficulties connected with laying is not found to be quite so satisfactory. The third type—which is far and away the most popular and which Mr. Edwards considers to be the best—is what is known as inlaid tiling. The tiling consists of two separate qualities of rubber which are put together before vulcanisation, and which after they have been in the hydraulic press cannot be separated from each other. The bottom layer is made of a grey resilient quality, while the top half is harder so as to withstand wear. Other advantages are that it is noiseless, non-slipping and beautiful; soft to walk upon, it cannot possibly harbour dust or dirt, all helping to render it the perfect flooring.

Last comes rubber carpeting. This was originated by a British manufacturer, but has since been copied in various parts of the world including Germany. Rubber tiling is vulcanised in a press, whereas rubber carpeting is made on a calender machine, making it possible to turn out rubber carpeting by the mile; in consequence there is a great difference in cost, rubber carpeting being, roughly, a third of the price of rubber tiling. A still more recent development of this rubber carpet idea has been the introduction of the thickness of $\frac{1}{16}$ in. instead of $\frac{1}{8}$ in. This has opened a still greater field, for already it is being extensively used for covering office and restaurant tables, counters, shop windows, and also for certain other purposes, such as wall of bathrooms.

The paper was illustrated with lantern slides of the laying of rubber roads in Edinburgh and Glasgow, and various floorings, together with wall covering.

THE BUILDING TRADE.

IE RATING AND VALUATION PROPOSALS.

s Government have drafted a Bill the of which is stated in the preamble to to simplify and amend the law with ct to the making and collection of rates otherwise, to promote uniformity in the tion of property for the purpose of rates axes, and for other purposes incidental connected with, the matters aforesaid." Memorandum issued with the Bill it is that the proposals contained in this Bill are submitted to the Associations cal Authorities, and other interests con-d, for their consideration and comments, ore, during the period allowed for con-tion, which we understand is three ns, it is of extreme importance that this hould be understood and any criticisms ggestions should be made, for this seems most unique opportunity offered by the nment for the careful consideration of al measure before it is introduced into ment, where as experience has shown, does not permit of such thorough in-ation of important measures as is often ble.

the Memorandum (paragraph 2) the objects of the proposals are stated to e simplification and improvement of the istrative machinery of rating and valua-nd the removal of various anomalies in-t in the present system, the substitution single valuation in the place of the te valuations at present required for ses of rating and taxation, and the pro-n of uniformity of valuation as a condi-precedent to any comprehensive review e system of Local Taxation and Ex-er Grants. The advantages which it is ed the Bill will bring are stated in para-3 of the Memorandum: "Economies e effected by avoiding the duplication of and the unnecessary expense occasioned e separate valuations for purposes of and taxes, the maintenance of a separ-ting authority for each of the 14,427 es, the levy of separate rates in urban (usually by separate staffs), the ob-multiplication of funds and accounts e valuation of each parochial section of y and other undertakings as a separate "

is an attractive programme, but care-nsideration will be necessary to ascer-ow far the proposals will affect the vers and whether the economies will them, or whether the Bill represents a fire for them in place of the frying-The Memorandum states that some of pposed reforms of the valuation system sed on the findings of various Commis-nd Committees of inquiry, others upon perience of the working of the Valua-Metropolis) Act, and that the rating s are mainly novel, although some of ger local authorities have obtained legislation in recent years to consoli-eir rates. In this preliminary notice do nothing but indicate some of the ns in the law proposed by this Bill ained in the Memorandum:—

arochial rating is to be abolished and s and urban and rural districts are to tituted as rating areas.

A General Rate is to be substituted present poor rate, district rate, high-te, etc., in boroughs and urban dis-nd in rural districts a general rate the place and having the same incid-the poor rate, and a special rate, y the rural district council on each r part of a parish which is separately le with special expenses under the Public Health Acts or lighting expenses under the Lighting and Watching Act, 1833.

In connection with this rate consolidation it is proposed to give effect to reliefs not in the assessment or collection of rates but in deducing "operative rateable values from gross values in the valuation lists," thus making it possible to levy the general rate at one and the same poundage in each area.

This is shown in section 16 and Schedule II. The gross value will be as heretofore the gross estimates rental, viz., the annual rent which a tenant might reasonably be expected to pay taking one year with another, the landlord bearing the cost of maintenance and the tenant paying the tenant's rates and taxes, so the case law will apply to this. But the "operative rateable value" is obtained by deducting percentages on scales as shown in the Schedule in place of maintenance allowances which, however, involves what appears to be a very complicated calculation. In this part of the Bill dealing with "rating" there are innumerable provisions which will require the most careful consideration. This deducing operative rateable values from gross value is one of them. At the present moment we can only say there are some useful provisions, and we may instance the provision which would make the contribution of an outgoing and incoming ratepayer to the General Rate correspond with the portion of the half-year he has been in occupation.

It is the second part of the Bill which may prove the most contentious, which provides that there shall be only one valuation, in the place of the separate valuations now required, for rating and taxation, that the values so determined should be the basis for the assessment of county as well as local rates, and that the gross values appearing in the valuation lists should be adopted as the gross values for the purposes of Income Tax Schedule A and Inhabited House Duty. This, as is stated in the Memorandum, is a system which has been applied in the Metropolis, but special considerations apply to the Metropolis, and its application to the whole country may be a different matter, for it will involve an interference with local self-government and a reversion to centralised authority. That this must be the case is shown by the paragraph in the Memorandum, which states: "The collaboration of the revenue officers with the local rating authorities will help to promote such uniformity, and inasmuch as the gross values are to be used for purposes of Imperial taxation it is, of course, necessary that the officers representing the Crown should be concerned in the preparation and revision of the valuation lists."

To carry this out we see it is proposed that two of the persons appointed by the County Council, or County Borough Council, as the case may be, to Assessment Committees, shall be General Commissioners of Income Tax. In the Bill "the Revenue Officer" plays an important part, and in section 60 this official is stated to be "Any Officer of the Commissioners of Inland Revenue authorised by the Commissioners to exercise any powers or perform any duties conferred or imposed on a revenue officer by this Act." The way this officer will function can be seen by one example. Thus where the rating authority has prepared a new valuation list it has to be delivered to the Revenue officer. If it appears to this official that the amount appearing in the preliminary statement as to the gross or rateable value of any hereditament is incorrect, or that the statement is in any other respect incorrect, he shall insert what is in his opinion the correct amount and shall make any other alteration therein as to him appears necessary. The rating authority shall consider these alterations, and if a difference of opinion arises, then the matter is referred to the Assessment Committee, upon which it must be remembered two revenue officials will sit, and before which the revenue officer will be present and be entitled to be heard and to examine any objector and to call witnesses. This officer has also the right of appeal against any decision of an Assessment Committee.

In a first notice of a measure of such complexity as this Bill it is impossible as well as undesirable to express any opinion whether for or against it. The Bill consists of 62 sections and five schedules, and the accompanying Memorandum is a document of 15 pages. We have only mentioned a few of the main provisions of the Bill, and our intention has only been to show that it will require the most detailed and careful examination. Some of its provisions, for instance those relating to the rating of railways and other undertakings as a whole, may prove advantageous and, as inquiry is invited with the view of obtaining suggestions from the local authorities and others interested, the good may well be winnowed from the bad in this measure, but we must draw attention to one clause which certainly should not be permitted to stand in any Act. We refer to clause 59, which applies only for a limited period, but which gives the Minister of Health power where any difficulties arise in connection with the first valuation list "or otherwise in bringing into operation any of the provisions of this Act" to make any appointment "or do anything" as appears to him necessary or expedient for bringing the said provisions into operation, and "any such order may modify the provisins of this Act so far as may appear to the Minister necessary or expedient for carrying the order into effect." We have hardly come to allowing a dictatorship in legislation even for a limited period, and only for the purpose of making an Act of Parliament workable we may mention that the rating of machinery is not included in the Bill as the Memorandum states the Minister proposes to appoint a Departmental Committee, and the question must be reserved until it has reported.

It is noticeable that the Bill, with two exceptions, is not to apply to London. Those two exceptions will not materially affect the present system in London as they are only the provisions contained in Part I as to precepts and the provisions contained in Part II as to the valuation of special properties (that is, tramways, docks, canals, telegraph or telephone works, gas works, water works, and electric light or electric power works), therefore the point which will be of the greatest interest to ascertain is how far the provisions of the present Bill differ from the present system in London, and how the system existing in London has been found to work in practice, for it appears that the evidence produced in these two heads will have a considerable influence on the reception accorded to the Bill.

Builders' Supplies for New Orleans.

The Department of Overseas Trade has received an inquiry from a firm in New Orleans who are desirous of receiving quotations and samples of slates, riding tiles, firebricks and builders' supplies from United Kingdom manufacturers with a view to purchasing on their own account or to acting as agents. Applications for further particulars should be addressed to the Department of Overseas Trade, 35, Old Queen-street, Westminster, S.W.1. (Reference 20143–F.W–M.C–(2).)

DAMAGE TO PROPERTY FROM HEAVY MOTOR TRAFFIC.

IN connection with the article which appeared in our issue for July 27 on "Heavy Traffic and Vibration," a correspondent writes urging combined action on the part of property-owners, and states that the National Citizens' Union would be prepared, if adequately supported, to take a test case where damage has resulted from vibration caused by the very heaviest class of motor vehicles.

Our correspondent also states that the law is deficient in the powers given to schedule side roads as unsuitable for heavy traffic, as under the Roads Act, 1920, a road can only thus be placed out of bounds when actual damage has taken place. We have not the Act before us to see what are its terms, but this scheduling of roads is a matter which should be dealt with on the application of the local authorities without delay, for if a local authority advises that a road should be scheduled it may be taken for granted there is good reason for it, as these bodies do not take at all a prejudiced view on motor traffic.

In an article in the September issue of the *New Voice*, the organ of the National Citizens' Union, to which our correspondent has drawn our attention, it is stated that on the Committee now being set up by the Ministry of Transport the ratepayers are not adequately represented, and there are other points in this article worthy of consideration. Thus it indicates that although through the action of the Ministry a more just distribution of the cost of road upkeep may result it is not a full remedy for the road trouble so far as the property owner is concerned, for his house is being shaken to pieces; and it points out that this question of vibration will also arise even if Lord Montagu's scheme for great motor-ways is adopted, for then the vibratory area and the compensation to property within the vibratory limit will still have to be considered.

The present problem of heavy motor traffic on roads forms a great contrast to the inauguration of heavy traffic on the railways. Our forefathers were impressed with the danger of the new kind of traffic introduced by the railways, and before that traffic was allowed to develop every possible precaution was taken. The railway companies had to acquire the land, all the amenities of adjoining property owners were safeguarded, and compensation had to be paid, not only for the land but for any injury sustained by vibration or otherwise. Motor traffic has, on the contrary, developed and extended on the roads until it closely resembles the heavy traffic conveyed by rail, but the legislation, instead of preceding it, has lagged behind and the property owner is uncertain as to his rights and is left without adequate statutory protection. The railway company remains burdened with rates and fenced in by statutory regulations, but the rival traffic on the highways, especially heavy through traffic, escapes the same burdens as to rating in the various districts it passes through and is immune from the question of compensation to the owners of property. The railway companies maintain their own rail roads, but the heavy motor traffic uses the public highways and its contribution to the upkeep of those highways is not proportioned to the wear and tear it entails.

In the article in question this question of the contribution to the highways is dealt with, and some figures are given showing the contribution to the Road Fund made by the various classes of mechanically-propelled vehicles. The question of the mere upkeep of the roads is not, however, the only point to be considered, and both our correspondent and the writer of the article lay very necessary stress on this point, for the damage to house property is also extremely serious and yet does not receive the attention it should do from those in authority.

We are in accord with the observations of these writers, that the vehicles themselves must be "tackled," that they must be built of less tonnage and with vibration absorbers, good springs, pneumatic tyres, and on principles that will ensure the least possible damage. Strict legislation on such points would assist the property owner in obtaining compensation for damage done to his property, for, although the user of the highway it itself may give no cause of action, damage caused by a breach of a statutory regulation would give a cause of action by itself if the damage could be proved to result from that breach. The property owner has good cause for anxiety, however, when he sees that even serious loss of life from motor traffic is almost accepted as an inevitable concomitant of motor traffic, and in this connection we may refer to the return recently made by the Metropolitan Police as to motor accidents in the London area during April, May, and June this year. A total of 12,962 accidents is reported, with fatal results in 153 cases. Out of this number of accidents, however, the private motor-cars contributed 4,445 accidents with 51 deaths, but "trade and commercial" mechanically-propelled vehicles come next with 3,391 accidents and 60 deaths.

THE BRITISH ASSOCIATION AND BUILDING.

AT least 280 different subjects were dealt with at the ninety-first annual meeting of the British Association held at Liverpool.

Professor Henry Clay, in dealing with "Post War Wages Problems," showed that the settlement of wages before the war was facilitated by the existence of well-understood and stable relations between wages in different occupations, kept in close correspondence with commercial exigencies by continual small modifications. The effect of the war was to dislocate those relations, interrupt this modification, and bring wages into correspondence with wartime economic needs instead of normal commercial needs. The post-war problem was to restore the stability in the relations of wages and the close correspondence with commercial possibilities that existed before the war. This involved changes from pre-war relations, and the recognition as lasting of changes that were still regarded as temporary, in order to allow for certain important changes since 1914 in the factors underlying wages. The chief of these were changes in the distribution of workers among different occupations; changes in the organisation of wage-earners; in the character of the work required; and in the markets of British industries. It was difficult to ascertain whether the general level of real wages had risen or fallen, and impossible to forecast its level in the future; so far, however, as a general level had to be assumed for the purpose of settling particular rates, it would prove necessary to take the average level of wages in export industries as the norm, rather than continue the present custom of taking the pre-war level of money wages and raising it to compensate for the increased cost of living.

Mr. Clarke dealt with the problems of re-housing the slum dwellers, in three main divisions: (1) Pre-war re-housing; (2) immediate post-war re-housing; and (3) the future. Under the first head, he reviewed the function of the private builder before the war. The work had been done by private enterprise, and he had come to believe that private enterprise could do whatever was required. The problem of re-housing on the same areas had been done in one case to the extent of 99 per cent., and in another of 95 per cent. After the war, owing to the cessation of building during the war, local authorities decided on a conservative estimate that they required a little more than one million houses. About 18 per cent. of the requirements in 1918 had been met. In an area near the Liverpool University 597 persons were living in 56 houses, with a total of 163 bed-rooms. Of those persons 349 were over 16 years of age. At Birkenhead, a house let before the war at 6s. 2d. per week was yielding its tenant 32s. 6d. by being sub-let. Another that was rented at 5s. 5d. before the war was sub-let to y 42s. 6d. per week.

The house shortage still being very acute a million men unemployed and receiving ou work pay from the Government, Mr. Cl urged that the Government should prompt action. All men between 18 and years of age, who had done no work for, twelve months, and could give no evidenc any prospect of work, should, he said, be cruited into the Royal Engineers to consti Housing Battalions on the lines of the Doc Battalions created during the war. Each should be given a course of trai at the e piration of which he sh be drafted into a battalion ready service. The Government should adopt housing survey of 1919 as the standard require this programme to be carried out. local shortage of man-power would be me reinforcements from the Housing Battalio occasion demanded. To prevent any que arising with trade unionists, the members Housing Battalions would be paid at the t union rates. At the same time the Govern should introduce a system of costings fo building trade as a whole. This was done effectively during the war in other trades, would have the effect of benefiting privat dustry as well as the natural and local auth activities. Where necessary, also, mat should be commandeered.

The paper by Mr. W. Barnes, M.I.M.E., with "The Development of the Single-bu Excavator." Single-bucket excavators in nection with the excavation for the fou tions of buildings were in common use, espec in America, where they were sometimes us remove only a few hundred cub. yds. of mat At one end of the scale they had the small line excavator, weighing about 20 tons, with a ¾ cub. yd. bucket. At the opp end was the huge 300 ton dragline excav which had just been delivered to cut the canals, some of them 200 to 300 ft. wid connection with the irrigation schemes in I About 20 dragline excavators were at use the irrigation scheme in the Sudan, and i an excellent proof of the usefulness and efficiency of those machines to know that could satisfactorily compete with the coolie labour in India and the Sudan.

Book of Normals (Section IV).

A book which should prove of interest large number of people has been prepar the Meteorological Office, Air Ministry published by H.M. Stationery Office. entitled "The Book of Normals of M ological Elements for the British Isles." S IV, just issued, price 3s. 6d., gives for 30 se places in the British Isles, for each month year, the average temperature and the h and lowest temperatures which may be exp also the average amount of rainfall and n of raindays. Such questions as: "What highest temperature reached at —— o normal August day?" "What is the lowes perature on the normal January night? what month is there normally the largest fall?" can be answered at a glance. In ad there are tables giving for various plac number of days of thunder, hail, snow, fro fog which occur on the average in each m

Lord Leverhulme's Scheme.

Viscount Leverhulme, describing to a representative his scheme for giving fr building sites to all who wanted them Spital estate, near Port Sunlight, said it experiment. When the house shortag apparent he advocated the municipality the surrounding fringe of land and stimu building by giving free sites. Smallholde to pay high prices for small sites. The cipality, he said, would have little beyond lighting and policing, and would get a high return on the transaction. proposed to allow eight or ten houses acre, including roads, and at present the nearly 500 plots.

THE SHORTAGE OF BRICKLAYERS.

THE Director of Housing of Edinburgh, Mr. ...sburgh Campbell, states :—The city has on ...d at present schemes for the erection of 1,774 ...ses, representing its immediate housing ...gramme. To carry through this work ...in a reasonable period a staff of 250 brick... ...rs or masons and bricklayers combined, is ...ired. Apart from the Corporation schemes, ...e are housing contracts proceeding in Edin...gh (including the erection of fully 200 houses ...he villa class), requiring approximately 600 ...ons and bricklayers. The total number of ...emasons in the city is 460, and of brick... ...rs 180—a total of 640. Of this number, ... 25 men are engaged in the work of house ...ding for the Corporation. It is apparent, the ...ctor of Housing observes, how deficient is ...skilled man-power available for the city's ...ing needs. A ten-fold increase is required. ...re-war times there were in the city 920 ...ons and bricklayers, so that the present ...e shows a reduction of 280. During recent ...ths 82 Edinburgh masons and bricklayers ...e left for America, where the wages offered ...ublic advertisement represent £18 per week ...a bricklayer.

...he first regrettable result of this insufficiency ...he practice of excess payments above the ...dard rates of wages to the men employed by ...in of the employers in order to retain the ... they have, and, if possible, to induce further ... into their service from other works and ...loyers.

...he following suggestions are put forward :— ...Representation to the Trade Unions to find ... for the housing work ; and to increase the ...ber of apprentices and trainees. (2) Repre...ation to the master builders not to offer ...cements above the standard rate of pay. ...ome possible restriction against the erection ...buildings which—without injury to the ...try—could well abide their time and stand ...poned. (4) In general, making it obligatory by Statute that housing work shall have precedence. (5) The adoption for houses of the kind which concerns the Committee, of materials —other than brick or stone—so as to utilise labour at present unemployed. (6) Building by machinery. This idea, although under trial and practical test, is not yet sufficiently developed for recommendation.

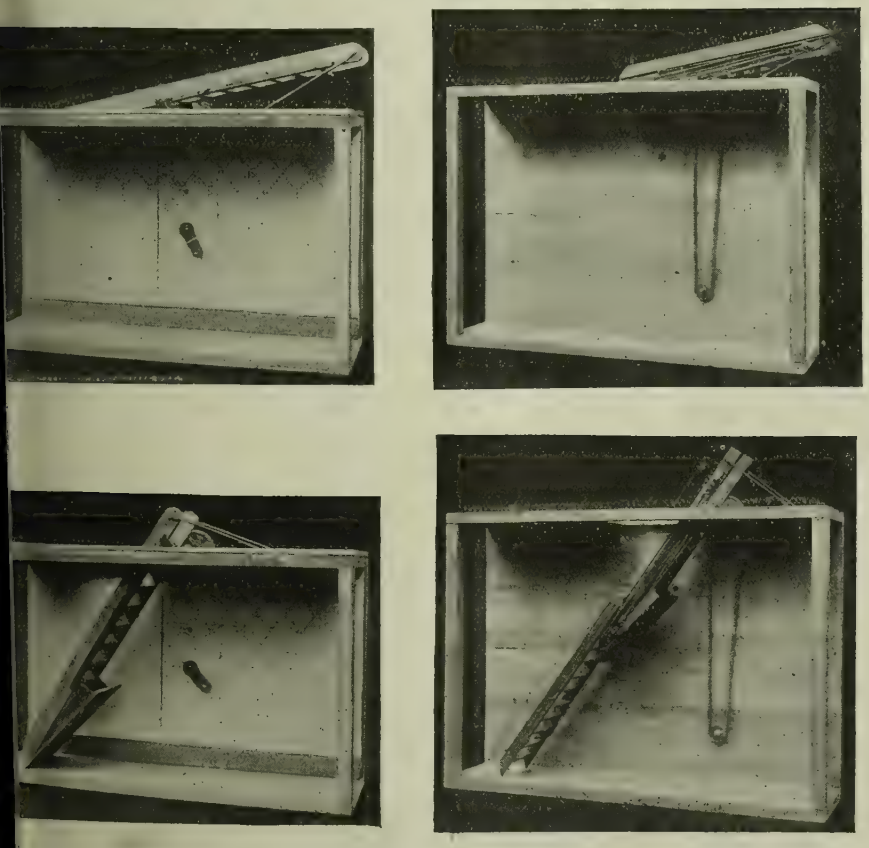
Side by side with this great shortage of skilled artisans is the fact that there are to-day in the City of Edinburgh about 12,500 men registered as unemployed, the cumulative cost of which to the citizens of Edinburgh is about £500,000 per annum, producing no economic return.

Dealing with the possibility of using concrete for house building, the Director of Housing observes :—"I am satisfied that the system holds the possibilities required to relieve the emergency with which the Committee are now confronted—that is, a hold-up of housing work ; or, in the alternative and constructive point of view, making the housing needs to subserve the cause of the unemployed, and so absorb hundreds of men in the city now workless. It might be added that the work could be undertaken by local contractors employing wholly local men."

NEW INVENTIONS.

"Easy Access" Stairs.

THE stairs illustrated have been specially designed to give easy and safe access to the usually wasted space in the roof void. By using the stairs, of which the accompanying illustrations give the general principle, the often considerable space in the loft becomes easily accessible.



The principle is as follows :- The undersides of the steps are provided for about half the upper length with racks which engage pinions on a shaft at one end of the trap opening. (On another pattern the shaft may be fitted with drum-barrels, from which wire ropes lead to the top and bottom ends of the steps instead of racks and pinions). Safety clips prevent the stairs coming off the pinions or drum-barrels. The shaft is fitted with a chain sprocket or worm wheel, which is operated by chain or worm from a handle situated at a convenient place on the wall below the trap opening. The handle may be detachable or folding, so that it does not protrude beyond the wall into which it is recessed, and is covered—when out of use—by a small door. The chain or worm is also encased. The lower end of the ladder itself forms the trap cover. At the extreme top end of the ladder are attached fulcrum links, the other end of which are pivoted either on or below the loft floor. When out of use the steps are thus housed in the loft itself, but are ready at hand whenever required.

The overhanging portion being longer than that in the trap opening, the weight of it will keep the trap well closed, and exclude draught and dust. By the single operation of turning the handle either way the stairs are lowered or hoisted, the trap cover automatically following the stairs. The lower end of the stairs travels in a practically vertical line between floor and ceiling, and therefore requires but little room.

The space required in the loft for the ladder when housed does not exceed 6 ft. lengthwise and about 3 ft. headroom, but it would naturally be placed where there was greatest headroom for the person using the steps.

Another pattern on the extending principle is intended for use in lofts with very limited space. It requires only about 4 ft. 6 in. lengthwise and about 2 ft. 6 in. upwards.

The patentee, Mr. M. T. Berner, is prepared to grant licences for the manufacture of the ladders.

Easy Access Stairs.

WATERPROOF SAND-PAPER.

THE Painting Trade Materials Committee write :—

"It is understood that legislation will be introduced to give effect, either in whole or in part, to the proposals of the Geneva International Labour Conference of 1921 in regard to the use of white lead in painting. The Government have not yet announced their decision as to whether this legislation will include any degree of prohibition of the use of white lead for the painting of interiors, but it is extremely likely that it will include regulations for the use of white lead wherever it is not prohibited. These regulations may be expected to comprise the set of regulations drawn up at the conferences of the Painters' and Decorators' Industrial Joint Council of Great Britain and representatives of the Home Office. One of these (Regulation 3 of the draft code) provides that 'surfaces painted with lead paint shall not be rubbed down or scraped by a dry process.' In view of the change of practice which will, in some cases, be necessitated, and in view of the well-known disadvantages of using ordinary sandpaper or glasspaper with water, the Painting Trade Materials Committee of Great Britain and Ireland think it right to call the attention of members of the trade to the introduction of waterproof sandpaper, of which more than one satisfactory make is on the market. While the chief merit of waterproof sandpaper in regard to the regulations is that it enables water to be used so as to avoid the creation of harmful lead dust, the use of waterproof sandpaper has the advantages that when clogged by the particles of paint it can be made effective by wiping or rinsing in water, and that the scratching of the surface by detached particles of abrasive is avoided. The lubricant action of the water also promotes smoothness of surface and rapidity of working. It appears to the Committee to be in the interests of the craft that members should acquaint themselves with waterproof sandpaper in order that they may have formed their own opinion as to its practicability for the purpose of their particular requirements before the Regulations come into operation, and they will also doubtless form their own opinion as to the relative merits of the different makes of waterproof sandpaper now on the market."

BUILDING ACTIVITIES IN EDINBURGH.

AN Edinburgh correspondent has supplied us with the following information :—

BOTH in the centre and suburbs of Edinburgh there is evidence of building activity. Bakers have been extending their premises in Princes-street, notably McVitie & Guest, at the west end, who now own the solid block from Charlotte-street to the entrance to their premises in Princes-street. Mackie & Son, having dislodged an adjoining firm, have taken over the premises, which are being organised for their business. Both these two bakers and confectioners, in addition to their normal business, have tea-rooms and luncheon-rooms. There is at present being erected on ground reclaimed from the Canal basin at Fountainbridge, off Lothian-road, one of the largest bakeries in the Kingdom, for St. Cuthbert's Co-operative Store. The iron girders and beams are supplied by Redpath, Brown & Co.; there has been a deficiency in skilled bricklayers which has delayed operations. Mr. William Grant, managing director of the biscuit firm of McVitie & Price, is to receive the freedom of Edinburgh shortly as a recognition of his generosity in giving £100,000 towards the conversion of the Advocates' Library into a Scottish National Library.

In the last report by Mr. Horsburgh Campbell, Director of Housing of Edinburgh, it was pointed out that the city had on hand at present schemes for the erection of 1,774 houses, representing its immediate housing programme. To carry this through 250 masons and bricklayers are required. Apart from Corporation schemes there are housing contracts proceeding in Edinburgh, including the erection of about 200 houses of the villa class, requiring about 600 masons and bricklayers. The total of masons and bricklayers in the town is 640, and of this number only 25 are engaged in Corporation work. There are 12,500 men registered as unemployed in Edinburgh, so that scarcity of skilled workmen is where the shoe pinches here as elsewhere. As a way out of these difficulties the report of a deputation from Edinburgh Town Council, which visited Newcastle and Leeds, has been favourably received upon the construction of concrete houses, similar to what was seen in England. The method recommended was the duo-slab system —a series of concrete slabs laid on edge one upon the other, without any liquid cement or mortar, the slabs being laid on edge in dry contact. These slabs are 4 ft. in length and 3 ft. high, composed of clinker, sand and cement. The mixing for the slabs is done by a concrete-mixing machine; when formed it is left until dry enough for use. The placing of the slabs can be done by unskilled labour. Newcastle Corporation has erected 311 houses by this system, and Leeds 1,600.

The sub-division of houses in the New Town, under Mr. John White, still proceeds, as also by Mr. A. W. Millar, F.S.I., in the old town. Only six individuals desired to avail themselves of the offer made by the Corporation in the way of a subsidy to builders or to private individuals who wished to erect houses for their own occupation. The subsidy is high, ranging from £85 to £150 for houses of three, four and five apartments. The lowest figure for a four-apartment house under this scheme is £570. The great difficulty, as already indicated, is in shortage of labour. The Corporation has schemes of reconstruction work in slum areas in Grassmarket and Leith. Approval was given by the Town Council for the spending of £283,000 there. Some time ago Principal Laurie explained to a meeting of the Royal Society of Arts a method adopted at some shale works for the utilisation of the shale in making bricks. If this method succeeds it might lessen the disfiguring mountains of shale refuse in the oil districts. Road widening has been done, or is still in progress, at Colinton-road, Morningside-road, Braid Hills-road, and elsewhere. In this last, fringing the great golf course, the road is being straightened and greatly improved.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-Masons' layers' Labourers.	Pla terers
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½	
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7	1/2½

Business Openings at Belgrade.

Captain E. Murray Harvey, O.B.E., Commercial Secretary at Belgrade, will be in attendance at the Department of Overseas Trade on October 1, 2 and 3, for the purpose of interviewing manufacturers and merchants interested in trade with the Serb-Croat-Slovene Kingdom. Such interviews will only be given by appointment, and applications should be addressed to the Comptroller-General, Department of Overseas Trade, 35, Old Queen-street, London, S.W.1. In all cases the reference 4937-T.G. should be quoted.

Spitalfields Market.

An improvements scheme at Spitalfields Market shortly to be put in hand is estimated to cost £2,000,000. The extension of the market to the west will give an additional area of about 87,500 ft. super., making the total area of the market about 213,000 ft. super., or over four acres. The improvement scheme provides that Lamb-street, on the north side, and Brushfield-street, on the south, shall both be widened to 60 ft., and the road suggested for the western side of the new market is to be 80 ft. in width. Altogether there will be an area of some 50,500 ft. super. available for use by market carts in delivering and taking away goods. To meet the requirements for re-housing people displaced by the new scheme the Corporation have acquired sites in Stepney for 600 people, and one block of buildings that has just been completed is in High-street, Shadwell. Inasmuch as the greater part of the buildings to be cleared away may be described as slum property, the scheme will not only be of great advantage to a market the business of which is growing rapidly, but to the neighbourhood and its residents generally. Traffic will also be largely facilitated.

Hull Housing Schemes.

At their last meeting the Hull Corporation Housing and Town Planning Committee adopted the plan of a proposed new street from near the Hull Paragon Station to the corner of Beverley-road and Spring Bank, in Prospect-street. The City Council have approved the principle, and the proposal will be included in the next Corporation Parliamentary Bill.

The City Architect was instructed to prepare plans for 600 parlour houses on the three Corporation Housing sites, the City Engineer to advertise for contracts for the necessary street work. It was agreed that individual houses erected privately should rank for subsidy if they occupied an eighteenth of an acre of land.

The Hull Building Trades Employers' Association wrote urging that the subsidies of £100 and £85, fixed by the Corporation, would not encourage a great volume of house building. If the investor in property was to be attracted they considered that the full provisions of the Act must be applied. Accordingly they asked the Committee to consider further the question of financing builders in connection with the Act.

It was resolved that, in connection with the buildings erected by general builders under the Small Dwellings Acquisition Act the Corporation were prepared to make advances on mortgage to the extent of 80 per cent. of the cost, the same to be repayable in 20 years.

WALL BOARD
Cheap and efficient substitute for plaster.
LYMUS WALL BOARD
(formerly known as LONDON WALL BOARD)
is waterproofed and fire resisting.
LIMEHOUSE MILLS, HOUGH'S WHARF, LIMEHOUSE, LONDON, E.

Weaver, bungalow, Parsonage-lane; Berks and Bucks Motor Co., Ltd., three motor lock-ups, Keppel-street; Mr. L. H. Pollard, bungalow, Parsonage-lane.

WOMBWELL.—The U.D.C. are considering the question of extending the baths, and the fitting of a new movable floor so that the hall can be used for public meetings.

WORTLEY (S. YORKSHIRE).—The R.C. have decided to construct a new road from the "Crown" Inn, extending to Hangmanstone Bar, at an estimated cost of £60,000.

YARMOUTH.—The plans passed by the T.C. for a new arcade from King-street, running west, and curving into Regent-street, at its junction with South Howard-street, provide for the erection of forty lock-up shops. The arcade will have a width of 14 ft., and be roofed over. It will take in Row 74, the south side of Row 73, and the north side of Row 78. It will mean the demolition of over forty small houses, and this prevents the work being put in hand immediately. As soon as other houses are available for the occupiers the rows can be cleared, and building operations started.

FIRES

CARDIFF.—A warehouse in Wesley-lane, belonging to Messrs. W. Kent & Co., has been almost destroyed by fire.

CIRENCESTER.—Barton Mill, occupied by Messrs. R. Townsend & Co., has been gutted by fire.

DONCASTER.—Damage caused by fire at Messrs. Hanley & Sons' flour mills, on Saturday, is estimated at £100,000.

GLASGOW.—Considerable damage by fire has been caused at the premises of J. Hart, 43, Mitchell-street, printer and stationer, and at the tailoring workshop of H. Brown, 37, Jamaica-street.

PONTEFRACT.—The garage of Messrs. Ewbank & Co., Wakefield-road, has been destroyed by fire.

NEW BUILDINGS IN LONDON.

Earlsfield.—FACTORY.—The Columbia Gramophone Co., Ltd., are about to extend their factory at Earlsfield to more than double its capacity.

Fleet-street.—BANK.—The general contractors for Barclays Bank in Fleet-street are Allen Fairhead & Son. The sub-contractors are as follow:—Stonework, F. J. Barnes, Ltd., 25, Nine Elms-lane, S.W.8; steelwork, Sanders & Forster, Thames Works, Hertford-road, Barking; lifts, Aldous & Campbell, Ltd., Lower Bland-street, Great Dover-street, S.E.1; electric light wiring, A. & F. Goodwin, 28, Minories, E.1. Messrs. C. J. Dawson, Son & Allardyce, Clock House Chambers, Barking, are the architects.

St. Pancras.—HOUSING SCHEME.—The architect of the B.C. has prepared estimates and plans for a housing scheme situated between the north side of Aldenham-street and the south side of Johnson-street, and including the east and west sides of Wolcot-street, this being the southern portion of the area included in the original scheme. The scheme presented by the architect comprises 72 flats, of two and three rooms in equal proportion, each having, in addition, a scullery, bathroom, lavatory, &c. The flats are contained in four blocks of 16, and one block of 8, each block consisting of four stories. The estimated cost of the work, including architects', quantity surveyors', &c., fees, is £49,110, and the value of the land is approximately £13,500, making a total expenditure of £62,610. Accommodation would be provided for 360 persons, as compared with 309 persons who would be displaced. The scheme is to be forwarded to the Ministry of Health.

London Stonemasons.

The majority of the London stonemasons came out on strike this week in support of a demand for a 3d. per hour increase in wages.

We are informed that as the result of the interchange of views between the national representatives of the builders and operatives, the representatives of the Regional Council for London is advised to hold a meeting at the earliest possible date, with the object of dealing with wages, hours of labour, and overtime. There is every possibility that the dispute may be ended this week.

PRICES CURRENT OF MATERIALS.*

[Owing to the exceptional circumstances which prevail at the present time, prices of materials should be confirmed by inquiry.—Ed.

TRADE NEWS.

Ir. J. Attwood, of Foster-street, Stourbridge, issued a new catalogue of heating specialities, ch includes many new lines. This firm nufactures the well-known "Eclipsem," eme," and "Cultivatum" apparatus; the ultivatum" boiler is specially designed for ting greenhouses.

mong the exhibits at the Cycle and Motor-le Exhibition at Olympia on October 15 be the "A.L." products of Allen-Liversidge, , of 106, Victoria-street, Westminster, .1. These are apparatus for brazing, lead ing, plumbing, soldering, paint burning, sundry uses in the building and kindred es as well as other industries.

& J. Main & Co., Ltd. (late Armstrong Iain, Ltd.), of Australia House, Strand, .2, announce that the reorganisation of the ness has now been completed. All the pany's branches are retained, and the Clydes-Works in Glasgow and Calcutta Bridge and Works in Calcutta are now more fully pped than before to deal with the same es of steel structural work as in the past, as as fencing, railings, and gates of every iption.

ssrs. J. Manger & Son, Ltd., the old-estab-l firm of soda manufacturers, of 57, High-t. London, E.8, have added a new line to well-known "Quality" products. This the form of a sugar soap for cleaning paint woodwork, and should be specially useful ilding repair and decorative work. In ion to the ease with which it cleans wood- and other materials, it has strong disin-nt properties. We are informed that this ct, which has only been on the market short time, is already being extensively ed.

very informative and useful booklet has ssued by the Lighting Service Department e British Thomson-Houston Co., Ltd., concise data relating to the design of ng systems for factories. The booklet is ded for the use of architects, engineers, manufacturers and others who are responsible for the installation and maintenance of, and extensions to, electric lighting systems in factories. Good lighting, to meet industrial requirements, can only be obtained after the very careful consideration of essential factors which, combined, necessitate numerous intricate calculations. Among these factors the height of workshop, the size of bays, and the spacing of units are a few of the most important. The designs in this booklet have been carefully compiled and are presented in such a manner that tedious calculations are entirely eliminated. One can obtain at a glance, given the height of workshop, size of bays, and the amount of illumination required, the exact spacing and type of units necessary to produce the best results. It will be found that a suitable design is available to meet the requirements of any workshop or factory with little or no alteration. The offices of the Lighting Service Department of the British Thomson-Houston Co., Ltd., are at 15, Savoy-street, W.C.2.

The illustration of the "Lefco" fireplace given below is from a catalogue just issued by the manufacturers, the Leeds Fireclay Co.,

Ltd., of Wortley, Leeds, which contains illustrations and particulars of a selection of various types of this fireplace. These fireplaces are made of Burmantofts terra-cotta—a material possessing a vitreous matt surface, which can be cleaned easily with a damp cloth. All iron-work is eliminated, and there is, therefore, nothing to rust and no unnecessary black-leading and cleaning. If the fireplace is preferred fitted with iron grate, ash pan and barless front, this can easily be arranged. These fireplaces are made with a minimum of jointings, and are therefore easily fitted into position. They are made only in a speckled-brown biscuit colour.

Liverpool Housing.

The report on the health of Liverpool during 1922 by the Medical Officer of Health states that 2,243 dwelling-houses have been erected in the city during that period, of which three are rented at £25 to £35 per annum, and the remainder at £35 and upwards. Of the total number erected 2,109 have been built under the direction of the Housing Department, these forming parts of Government-assisted schemes.

NEW BUILDINGS IN SCOTLAND.

Brechin.—HOUSES.—The T.C. has decided to erect two four-roomed houses under the Board of Health's original scheme.

Leith.—HOUSES.—The Housing Sub-Committee of the Edinburgh Corporation has received tenders for the erection of 66 houses at St. Clair-street, Leith. The lowest tender worked out at a little more than £350 per house.

Clarkston.—SCHOOL.—The Master of Works to the Lanarkshire Education Authority has been requested to prepare an estimate for a new school at Clarkston.

Portobello.—CONVERSIONS.—The Wakefield City Council is applying to the Health Ministry for sanction to borrow £3,000 for the adaptation of four houses as shops.

Whitecraigs.—HOUSES.—Plans have been passed by the Buildings Committee of the Upper District of Renfrewshire for the following:—House in Elphinston-road, for Mr. H. Thomson; villa at Craignethan-road, for Mr. J. G. Williamson; villa at Roddinghead-road, for Mr. W. Rowell; villa at Roddinghead-road, for Mr. G. Robin.

Murthly.—PUBLIC HALL.—Funds are being raised for a new public hall for the village of Murthly, Perthshire, the sum of £960 having been raised up to the present.

Ayr.—DWELLINGS.—The Dean of Guild Court has passed the following plans:—20 two-story cottages in Marchfield, estimated to cost £14,000, for Mr. T. McWhirter; Mr. R. Hutchinson, six houses of the bungalow type, to be erected in Robbsland-avenue off Monument-road, at an estimated cost of £4,900; Mr. W. Telfer, for a double cottage in Hunter's-avenue, the cost of which is estimated at £1,600; Mr. F. H. McPherson, for two bungalows in Robbsland-avenue, at a cost of £2,400. The question of extension and reconstruction of the slaughter-house has been referred to a special sub-committee.

Kirkcaldy.—VARIOUS.—The T.C. is considering the erection of a slaughter-house on a more convenient site. The Dean of Guild Court has passed plans for three houses and two shops at the corner of Sutherland and Viewforth-streets, for Mr. J. Malcolm, builder; and a cottage at William-street, for Mr. R. D. Venters.

Hamilton.—HOUSES.—The T.C. has approved of plans prepared by Mr. James Lochhead, architect, Hamilton, for the improvement of insanitary areas in the fourth ward. Under the scheme the erection of 120 houses will be proceeded with. The estimated cost is £37,424.

Kilwinning.—HOUSES.—The T.C. has concluded contracts for the erection of 14 houses on the Stevenson-road site, amounting to £5,702 5s. 7d. The Northern District Committee of Ayrshire has passed plans for new buildings, including a cottage at Kilwinning, cottages at West Kilbride and Portencross, two bungalows at Kilbirnie, houses at Largs and West Kilbride, and two "flatted" houses at Southannan and Fairlie.

Giffnock.—HOUSES.—The Buildings Committee of the Upper District of Renfrewshire has passed the following plans for houses at Giffnock:—Villa, Eastwood Mains-road, for Mr. J. Crofts; double cottage, Milverton-road, for Mr. M. Wallace; bungalow, Davieland-road, for Mr. Pitt; double villa, St. Ann's-drive, for Mr. P. Gray.

Broughty Ferry.—SWIMMING BATHS.—The Dundee Corporation Markets and Baths Sub-Committee will report on the estimated cost of providing a swimming pond with six plunge baths, six washing stalls, one extractor, and a drying machine.

Yoker.—HOUSES.—The Housing Committee for the Upper District of Renfrewshire recommends the erection of 60 houses at Yoker by the District Committee.

Ruthergien.—HOUSES.—The T.C. has fixed contracts for the erection of 58 houses on the Gallowflat site, and they propose to borrow £30,000 to carry out the work.

OL. CXXV.—No. 4209. OCTOBER 5, 1923

WORK AND LEISURE.

THE increase in the number of working hours per week in the building trade is a significant factor amidst our industrial troubles, although it has come as rather a disappointment to the prospective building owner that the increase in hours does not represent any ease in the cost of his building. Even so, it means that e work will be done in a working day, a fact which is of the ost importance when we consider the shortage of houses. 'he question of longer working hours per week is of greater ificance than appears at first sight. It is a factor which is up a large field for discussion and—as always—there are sides which are diametrically opposed. In a general way fairly obvious that the idea of shorter working hours is upon a basis which is largely sentimental, in the sense a large number of people who have no direct interest in stry sincerely desire to see the workman obtaining and ying better conditions than he had, say, in pre-war days. s important, however, to observe that these people are ier clear about what they mean by better conditions, nor these conditions are to be obtained and maintained. It is incredible that a person could hold these theories and e us to say that he feels compelled to wait until building s reach a figure at which he can afford to build. Further plications arise when we see that there are a number of ors which, in the opinion of many economists, cannot be nciled. There is a theory that the workman is entirely master of his fate; that his standard of living is directly nected with the amount and cost of the production. osed to this is the theory that conditions must come first; the standard must be set and trade will follow. It is that those who adhere to this theory express their views form which disarms us by its moderation. Reasonable king hours, reasonable wages, reasonable living conditions, onable security of employment, and so on, constitute rmidable group, particularly if we do not all agree upon definition of reasonableness. At the back of the whole blem is the irksome duty involved in work: a thing to be ied on and borne with, because we cannot go on living any other terms, despite the flamboyant phrases served to us about a better England. It is perfectly right that ur should press its claim to as much more than the bare istence wage level as the industry can be made to pay out injury to its prosperity; the difficulty is, how to e at that figure, when it is apparently so easy to find other ons to account for bad trade. It seems to be an established that leisure must be paid for, and individually it is an llent arrangement if we can get others to pay for it.

n these days we have become involved in statistics, which be used as the occasion demands. Where wages are fixed he hour it is simple enough to work out the percentage ase over pre-war figures, yet most of the published tables alculated upon a workman's weekly earnings. Obviously ncrease appears less than we had in mind owing to the ed number of working hours per day. The amount of y which is paid in a given time for work is a factor which tly affects the selling price of the article, and the absurdity sing our calculations upon any other basis is exposed if ssume the amount of wages per hour to be doubled, and number of working hours halved. There would be no ase in the total wages at the end of the week, but it is ple calculation to see that the labour costs of the work been doubled. A stage is reached when a man cannot out more than a certain amount of work in a given time, the selling price can only be lowered by scientific manage- and the use of efficient machinery. This has been clearly nstrated in the manufacture of certain articles which ot be classified as necessities; either the prices are lowered ing the demand or the factory closes.

The whole problem simply resolves itself into a question of the relation of work to leisure, with the important factor added that if we work shorter hours we require more payment. It is evident that the happy mean will not be found until it is realised that the wage per hour and the wage per week are two different factors producing economic results which differ widely. It is at least significant to note that, although the rate of wages per hour in many industries appears to be high, the number of hours worked has been low owing to the bad state of trade. We will not say definitely that this is merely cause and effect; we merely point out that a high wage per hour does not connote a high wage per week; on the contrary, it may mean a lower wage than pre-war, while the cost of living is higher. Meanwhile the cost of the article is maintained at a high level. In our opinion this is the true explanation of the recent objections which were raised against the acceptance of the index figure of the cost of living in relation to wages. When wages were raised during the war no complaint came from the trade unions that the index figure did not accurately represent the cost of living, but under the decline of wages consequent on the downward movement of the index figure the accuracy of the figure has often been challenged. The inferences which we would draw are these: that the method of fixing wages in relation to an index figure is as sound a method as could be devised, but the failure is that it cannot guarantee good trade and employment.

There is again a further complication which requires investigation by those who have no definite conception of what they mean in their references to the standard of living. Statistics have been published showing that the total consumption of certain foods has increased enormously; the increase is in the expensive and better-class goods, while the demand for the cheaper qualities has fallen. We confess that we find it difficult to accept these statements in so far as they apply to the workmen, though we bear in mind that for some years many people found themselves able to satisfy tastes which had previously been beyond their reach, and that the expenditure on food, clothing, amusements and holidays reaches a point without precedent. Accuracy is essential if we are to avoid irrelevant discussions all round the point, and it is obvious that there are many factors which are yet obscure. It is unnecessary to say that everyone sympathises with the workman in his discontent, which is inevitable under any process of curtailment, but it cannot be said that the method of putting conditions first is not being severely tested.

The experience will not be in vain if in the end it is discovered that the elusive factor governing the welfare of everyone engaged in industry proved to be the amount and quality of the production in relation to its selling price. Something is wrong with the economics of industry when the nation has to pay a dole to provide work, and it is evident that these measures can only be based upon the assumption that the industrial depression is merely temporary. No one believes that the Government is either indifferent or inactive, but very few realise the unfairness of saddling it with a problem which is so very one-sided. It may be that in providing relief work we are helping to maintain a price basis which in turn throws others out of employment. We would prefer to see an attempt to seek good trade through the adjustment of prices, and it is in this direction that we look for help from the workmen and their leaders instead of from the Government, which has no control in these matters.

The increase in working hours for the building trade may be the first movement towards a better understanding of the principles which govern our work and leisure, and of the fundamental differences between rates of pay per hour and an adequate weekly wage.

NOTES.

Obsolete By-laws.

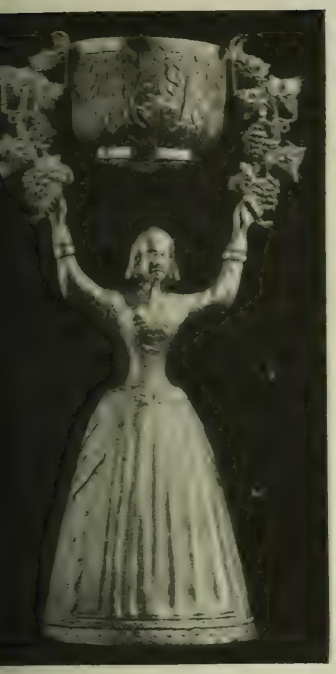
It is satisfactory to see the record in the thirty-fifth annual report of the Sheffield, South Yorkshire and District Architectural Society, just issued, of the Society's attempt to bring about a better consideration of the revision of obsolete and hindering by-laws. The Council gave instances in which building owners in that district had suffered severely from the insistence of following obsolete by-laws and offered its assistance in their revision.

Demolition of St. Alphage.

The demolition of this church has now begun as the result of the union of the benefice with that of St. Mary Aldermanbury. The refusal of the vestry at first to sanction the demolition had reference to the existence of the fourteenth-century tower, the only remaining part of the old Elsinge Spital, the first institution to be founded for the blind. The tower is, however, to remain, and the consent of the vestry was only given when this was agreed. A portion of the old Roman wall is still preserved in the churchyard. It may be mentioned that this is not, like other old City churches, the work of Wren, having been erected in 1777, at a cost, so we are told by a contemporary, of £1,350, this amount appearing in the old records of the church.

Designing an Exhibition.

One unusual feature of the Decorators' Exhibition which will open at the Holland Park Hall on October 17 is the arrangement of the space. The usual method in planning exhibitions is to cram as many stands as possible on to the floor. Quite a different plan has been followed in the case of the Decorators' Exhibition, which is not, we understand, a commercial venture, but mainly a means of attracting the attention of the public to the possibilities of the decorator's craft. It is hoped in this way to stimulate business, and also to show the decorator himself the latest things in materials and methods. The object in planning the floor space, therefore, has been to make as attractive an exhibition as possible, rather than to let every possible foot of space. In the centre of the hall there is a wide open space approximately 60 ft. square, which, from the point of view of the attractiveness of the exhibition, is a real asset. There are lesser open spaces on either side, so that every stand in the hall can be seen to advantage, and the exhibition, instead of being a labyrinth of narrow passages bounded by stands, will be an affair of broad spaces, round which will be arranged exhibits of unusual attractiveness. This, most people will agree, is the "better way" in exhibition planning.



Pilaster in the Cathedral, Rimini.

Soane's Pupils.

Mr. A. T. Bolton is certai making well known the val of the Soane Museum, which he appears to be most energetic curator that it has e had. The state of architectural edu tion in this country after the Fren Revolution is illustrated by some accou of the 55 members of the staff of Sir Jo Soane in a pamphlet entitled "Archit tural Education a Century Ago," j produced by Mr. Bolton. Special note given to the career of Soane's m distinguished pupil, George Basevi (d 1845), architect of the well-known Fi william Museum, Cambridge. The deta given in this interesting publication sh that the study of architecture was follow with much genuine enthusiasm even those dull times. This, at least, we ho for our present-day students, that genuine love for their art may inspire a guide them so that they may make t dry bones of construction to live.

Art Metal-work and Jewellery.

Our attention has be drawn to the beautiful g and silver-work, jewelle and enamels produced by Colonial artist, Miss Francis, who shortly returning to Australia, af several years' work in the practise of l art in Europe. Her productions, whi maintain high traditions of design a workmanship, have been exhibited the Royal Academy, the Royal Colon Institute, and the Paris Salon, and ha been recognised by the South Kensingt diploma and silver medal. There great refinement and versatility abo Miss Francis' work, which is entirely do by hand. Though largely based traditional motifs, her designs are origi in the best sense, and are worthy p ductions of this period. The Limo enamels are composed of grains of fine ground coloured glass applied to a cop plate and pushed into position, after be fused together in the furnace. Th enamels are delightful with their gorge iridescent hues, and are mostly based the old masters. This artist seems equa at home with cloisonné work, in wh the enamel fills the spaces formed by g wire twisted accurately into patter In this and in other kindred departme of the art—jewelled silver caskets, p boxes, finger rings and other *objets d'ar* Miss Francis displays considerable r traint in the use of ornament, which adapts to the nature of the object which it is applied. She retains, too, due proportion between stone and setti and in repoussé work there is vitality a gracefulness, amply justifying the abse of superadded garnishing. In the cha ing pierced work of her necklets a pendants she manages to combine t freshening spirit of natural forms w the impress of her creative power, and produce a texture of plaited and twis

ister orial ard.

A POWERFUL plea for the preservation of the Lister Ward at the great Glasgow Infirmary has been issued . J. A. Morris, A.R.S.A., F.R.I.B.A., nemorial to one whose services to nity can hardly be over-estimated. alue of a building as a memorial, hough it be comparatively modern, oubted, and the volume of opinion reighty and distinguished in favour retention of the ward in which evolved his experiments, as a durable ial of his great services, that it is t to see how the hospital authorities hore it. Mr. Morris deals with the ons urged against its preservation nd convincingly, and we sincerely is efforts will meet the success they . He appeals " to those in whose the destiny of the memorial ward think thrice before they remove so a landmark in the progress of ity."

---

olicy the .A.

THE Council of the R.I.B.A. has, we are informed, appointed a Charter and By-laws Committee for the purf considering and advising the upon the revision of the Charter y-laws. This Committee has also been directed to consider the question of the general policy of the R.I.B.A., to explore the existing situation, and to submit a report to the Council upon it at the earliest practicable date. The Committee consists of the following members: Mr. J. Alfred Gotch, President; Major Harry Barnes, Mr. H. T. Buckland, Mr. E. Guy Dawber, and Mr. W. Curtis Green, Vice-Presidents; Mr. Arthur Keen, Honorary Secretary; and Mr. Herbert A. Welch.

Guides to Housing.

A USEFUL work has been done by the Garden Cities and Town Planning Association in the issue of three leaflets on Town Planning, Public Utility Societies, and the "Chamberlain" Housing Act. We have passed through so many phases in regard to housing that the public may well feel somewhat bewildered as to the exact position to-day. Even now, as the leaflet states, it may be necessary to introduce a new housing policy, but houses are so urgently required that any doubt as to this should not stand in the way of making the fullest use of the present policy. It is a definite attempt to induce private enterprise to take up housing where official authorities have failed, and it remains to be seen whether the inducements offered will lead to the desired results.

"Honesty and the Crafts."

A PAMPHLET with the above title, written by Mr. S. G. Russell, of Lygon Cottage, Broadway, contains a plea for a more genuine craftsmanship, founded on a workshop practice which does not limit the scope of the worker to the mechanical repetition of some fraction of the whole product, but permits him to make the whole table or chair; and we are glad to know that this is not advanced theoretically, but is actually the practice in Mr. Russell's workshops, as we are glad to think it is in some others. He goes on to ask that repairs to old furniture should be frankly repairs, and not intended to deceive, so abolishing shams and the faking of old furniture, and doing things rightly and honestly, not disregarding traditional ways of doing things but "determined to make the work of the present as good as the work of the past—and why not?" It is evidently a very much more intelligent view which directs us to see in the work of the past the best expression of ourselves, which finds in old work the sound practice and direction, the conduct and outlook which are qualities inherent in all time, without making a fetish of it. The improvement of workshop practice which is growing among the younger craftsmen is the re-assertion of human values against their disregard, bringing with them the liberation which such connotes.

Pilaster in the Cathedral: Rimini.

GENERAL NEWS.

Professional Announcements.

Mr. Walter W. Gibbings, architect and surveyor, late of 231, Strand, is carrying on his practice at new offices at 53, Great Marlborough-street, W.1. Telephone: Gerrard 6158.

Mr. Ernest J. Thomas, Licentiate R.I.B.A., P.A.S.I., late of 120, High-street, Gosport, and Pearl Buildings, Portsmouth, has recommenced practice at No. 30, Landport-terrace, Portsmouth, and would be pleased to receive manufacturers' catalogues.

South Wales Institute of Architects.

The 33rd annual report of the South Wales Institute of Architects, allied to the R.I.B.A., contains information of use to architects and others connected with the building industries in South Wales, and records the many activities of the Institute during the past year.

Architect's Death.

The death has occurred at Knaresborough of Mr. Geo. Wilson, architect and surveyor. He was Surveyor to the Knaresborough Council for 14 years. In the open competition for the laying-out of the Castle gardens, which was carried out in commemoration of Queen Victoria's Jubilee, Mr. Wilson was awarded the first premium.

Bury War Memorial.

The Bury War Memorial Committee has asked Sir R. Blomfield, R.A., to submit a design for a war memorial in the centre of the town. The proposal is to erect a memorial near the Market-place, the site for which will be obtained by taking a portion of the graveyard of Bury Parish Church. The memorial is in conjunction to the erection, equipment and endowment, at a cost of about £42,000, of a new Children's Ward at the Bury Infirmary, which is now in course of erection.

"The New Day."

We have received the October number of *The New Day*, a monthly summary of the work of the Women's Housing and Village Councils Federation. The Federation has now formed councils in eleven counties, which has greatly stimulated women's interest in housing and national health.

Liverpool Architectural Society: The Honan Scholarship.

A travelling scholarship of the value of £50 for one year is open to members of the Liverpool Architectural Society under the age of 30. In computing the age the time spent in war service may be deducted. The scholarship will be awarded for the best design submitted for an entrance to a road-traffic tunnel under the Mersey, connecting Liverpool and Birkenhead. Competitions marked "Honan Scholarship" are to be delivered at the Society's Rooms, 13, Harrington-street, on January 1, 1924, and candidates must have been associates or students of the society on December 31, 1922.

The Architectural Association.

The list of meetings and other gatherings in connection with the Architectural Association for the 1923-24 session has now been issued. The session will open on October 19 with an address, illustrated by lantern slides, on "The A.A. Excursion, 1923 (Avignon)," by Mr. Gilbert H. Jenkins, F.R.I.B.A. The other Monday meetings for the session are as follows: November 26, "The Value of Study of Old Buildings," by Mr. J. Alfred Gotch, P.R.I.B.A.; January 14 (subject to be announced at meeting), Professor A. E. Richardson, F.R.I.B.A.; January 28, "The Case for the Preservation of Old Buildings," Mr. Basil Oliver, F.R.I.B.A.; February 25, "The Gothic Survival," Mr. H. Goodhart-Rendel; March 24, "Modern Swedish Architecture" (lecturer to be announced); April 28, "The Role of Phantasy in Art," Mr. H. Crichton Miller, M.A., M.D.; May 12 (subject to be announced).

The monthly exhibitions (open from 10 a.m. to 10 p.m.) will be as follows: October 1 to 27, Members' Holiday Sketches; November 5 to December 1, Lighting Fittings; January 14, Architectural Draughtsmanship of the Last 100 Years; January 28, Bricks and Tiles; Feb. 25, Drawings by F. L. Griggs; March 24, Modern Swedish Architecture; April 28, Wood Carving; May 26, Modern Furniture. All members are invited to send sketches, &c., for the annual exhibition, to be held between October 29 and November 22. Sketches, which should be framed and labelled, must be delivered to 9, Bedford-square, by October 15.

Buildings at the Gothenburg Exhibition.
(*See page* 520.)

COMPETITION NEWS

Park-avenue Church and Schools, Northam

The design placed first in this competition was by Messrs. George Baines & Son, F.R.I.B.A., F.S.Arc., 121, Victoria-street, Westminster, S.W.1. The estimated cost of the section to be proceeded with is £15,000.

Birmingham.

This week we illustrate the third premiated design in the Birmingham Masonic Temple Competition, by Mr. Hurley Robinson. The first premiated design and the assessor's award were given in our last issue.

Taunton.

Designs for a war memorial, for the Council Taunton School. Sending-in day, November Conditions may be seen at *The Builder* O (See our issue for September 21.) This is to an art and science block of an approximate of £10,000. Mr. Robert Atkinson, F.R.I.B. has been appointed assessor with power to a a second assessor if considered necessary. premiums are offered, £100 to the sele design, which will merge into the archit commission, and £50 to the design placed sec

Memorials to the Missing.

For the Imperial War Graves Commission.—Designs of memorials to the missin four battlefields on the Western Front. S ing-in day, January 1, 1924. (See our issu August 3.)

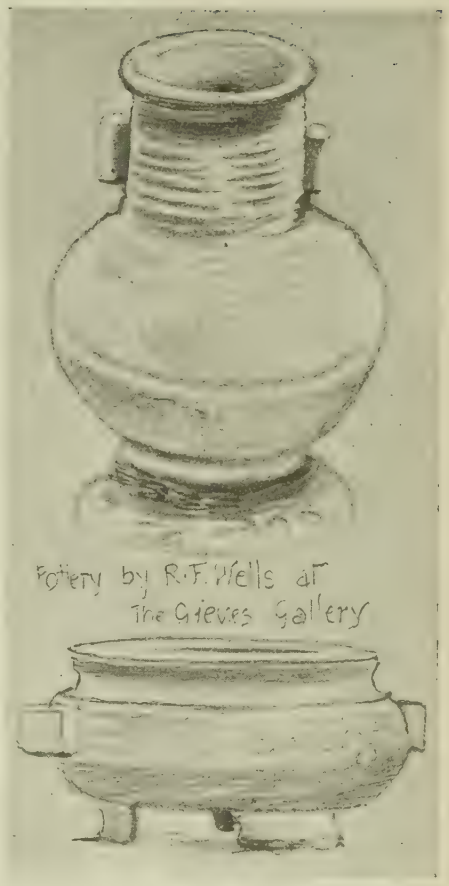
NDEPENDENCE OF BEAUTY AND COST.

By J. HEMBROW, A.R.I.B.A.

Any building in which sufficient money is ailable for methods of sound construction ay have beauty. Its beauty depends wholly, the architect has a reasonably free hand, on the genius of the artist, and not the nount of money per cubic foot which can be ent. A common statement heard at the ection of work where only just sufficient means available to gain the accommodation required, that "nothing could be done from an archi-ctural point of view, because no money was ailable." This is mere indifference or incom-tence. The most beautiful things of life are ose obtainable without the command of ealth. Happiness is the offspring of just ring, and happy effects are the result of right ilding. Ornament in building is like luxury life—pleasant but not necessary. It is wise set about building with the determination at beauty shall be obtained first, and orna-ent added to complement it after.

We know that the highest beauty in art is tained with the minimum of elaboration, and at the lower forms and periods of art hold the aximum amount of mere decoration. In the wer races of humanity, where culture has ached only an elementary stage, as we judge we find the most profuse and costly decoration nceivable, involving enormous labour and rrible suffering; and yet the grand simplicity the classic proves the exact difference between e relative levels of the peoples. The Roman chitecture was much more profusely orna-ented than the Greek, yet it was admittedly wer in type. The beauty of the human figure ists in spite of clothes—not because of em.

In order to obtain beauty in architecture, it relatively negligible what money we may or ay not have for embellishment. It is vital, owever, to find the form most suitable to the urpose of the design which, when expressed with ire and taste and made permanent in good aterials, will give beauty just as the figure of ne man brought up to physical labour or nother to intellectual effort will each have its wn separate significance. Having obtained this undation of beauty, its dress according to the eans disposable should suit its purpose, ther in the elaborate form suitable to some portant civic building or the simplicity of a oup of humble cottages. Just as one should fferentiate in the clothes of a high personage d a humble one, we must discriminate in our ildings without losing sight of the fact that the mble personage or building may have the eater beauty of the two. Form, which is the sis of beauty, may have to be obtained in ite of many difficulties, but each difficulty s its solution if it is approached with con-ence and determination. Limitations must accepted without fretfulness and made into portunities; the problem which appeared some and dull can generally be solved in a y which will have an individuality and erest beyond any easily conceived and corded design which comfortable circum-nces might have made possible.



We have to consider also the best expression form, and here one is faced with the limitations material. In one district stone will be out the question; in another brickwork may be nd less easily than stone. Roofing materials ry, different kinds of craftmanship may be ficult and costly to obtain, but each material combination of materials forms an interesting dy, either from the point of view of colour surface and as the motives of the design are vast importance. Is it superfluous to point how hideous buildings become when the penditure of large sums of money is entrusted vulgar designers? It is a custom with all us to praise the beauty of the old half-bered houses and the old stone cottages of e centuries ago; but they appear in these ms, not because their designers in all cases se the most ornamental mode of expression, but because those forms and materials were the outcome of local conditions. The best and strongest buildings, except by accident or vandalism, have remained, and thus we have the happy result of right building. This emphasises the fact that we have to find the most suitable form for our purpose and the best material that we may attain to beauty. Finished work will not necessarily be more beautiful because part of it has come from Italy and India, but only more highly ornamental or costly. Where there is little money for ornament, it is often possible, by the judicious disposition of materials, to gain charming effects of colour; or, if little colour may be obtained, some careful method of design may give us the dignified plain surfaces and simple beauty of, say, the late Georgian period.

However exacting a material may be, it will be found to have possibilities of its own. The artist who designed the steelwork of those two beautiful bridges in Paris, the Pont Mirabeau and the Pont Alexandra, seems to have taken into account the very shadows of the rivets in their treatment, and so economically and justly have disposed this generally considered ugly form of construction (steel) that the steel-work itself is a thing of beauty, apart altogether from the ornamental features so well conceived and disposed. In shaping a beautiful building it is necessary to proceed as though we wished to make a painting of a beautiful human figure. Everything will depend upon the selection and realisation of the figure, and, having obtained it, it may be our fancy to clothe it; but the beauty of the work will lie in the figure itself. Bad taste in its clothing may even detract from its apparent charm. If it is a high personage to be clothed, the robes must be fitting their royal purposes; if a humble, they must be simple; but the result will remain a handsome king or a handsome peasant. In fact, so definite is this that while one might dress the high personage simply without much injury to his dignity, the humble one would be ill at ease in kingly wear. In the treatment of buildings naked beauty must be first obtained, then it may be clothed according to its purpose and our means; and, whatever its end, it will be beautiful.

So far does sympathetic observation corroborate this that the most casual observer even of the development of our towns, and particularly our suburbs of late, will find that the excessive ugliness of a very large part of them can directly be traced to their great cost. A sympathetic study of some of the continental and some exceptional modern English methods governing building will show us where beauty has been obtained in a substantial manner at considerably less cost than the weary ugliness we have hitherto associated with the growth of towns. It is not suggested that these modern styles of building have been more beautiful *because* they were cheaper, but it is contended that they have beauty and have been cheaper because the money expended was used in an artistic manner and affected the most vital elements of building; and because not only was the design of one building considered, but its relative effect on and the effect of other adjacent buildings upon it was taken into account when its style and type was decided and the possibilities and suggestion of the surroundings themselves were studied with care.

One of the most important matters—infinitely more important than the amount we are going to spend—is that the design should be suitable to its surroundings, either surrounding country or surrounding buildings. This effort is hampered somewhat cruelly when the surrounding features vanish or are wantonly destroyed, a contingency for many years unavoidable in this country, but certainly possible of avoidance now. In many districts, for instance, private acts exist compelling the culverting of all streams—surely one of the most costly methods of destroying beauty and seeking ugliness that could possibly be devised. Certainly no architect wishing to lay down a beautiful village would begin by doing away with an element so naturally beautifying and so likely to confer additional beauty. The beauty of a group of cottages does not so much depend upon the cost of them, but upon whether the individual buildings are interrelated and harmonious as a whole, or conflicting and badly considered. This is admirably illustrated by the cottages on the Duchy of Cornwall Estate, Kennington, S.E., or roads like Asmun's-place at the Hampstead suburb, each of which are suitable to their own individual setting, and are grouped together in their proper significance, and either of which would look wrong and possibly ugly if their settings were exchanged. Smith's-square or Lincoln's Inn are more beautiful than Leicester-square, but not because the buildings composing them are more costly; they are, in the main—in the first example, at any rate—the plainest of plain Georgian; while Leicester-square has the elaborate fronts of two theatres. But the features of Smith's-square are balanced and interrelated—were, in fact, designed. What ornament could add to the charm of Staple's Inn? Would it not detract from the beauty of the plain, gentle dignity of the houses, which have all the quiet beauty and simplicity of the best thought of their century? Would Staple's Inn be more beautiful if the buildings around it were richly ornamented at great cost? To create beauty it is not so much money as brains that is required—not so much the unlimited expenditure of a spendthrift purse as the generous expenditure of the heart of the artist. In simple taste we can have beauty, while the largest purse misapplied will bring nothing but tawdry poverty.

How many an old barn has more beauty than some of our modern churches and civic buildings, smothered in ornament? The difference is not so much that which lies between a barn and a church as between a good plain barn and a bad ornate church. Or what one of us does not

Pottery by Mr. R. F. Wells at the Grieves Gallery.
(*See p.* 523.)

know of the villa erected by some successful retired man of vulgar mind, designed by his successful speculative builder, with a drawing-room a bad "Choctor," a dining-room like a saloon bar, and a hall like nothing on earth? And who has not turned with relief to simple plaster walls done in plain, delicate shades. We realise at once that it is not the expenditure of money but of art which makes success. Half the ugliness of our streets is due to the anxiety of young architects to dominate the street with the vigour and originality of their own designs, irrespective of the proper office of the building designed in regulation to its neighbours. In such cases buildings lose even their own value as examples of individual design, and become mere arrogant and egoistic nuisances which annoy and disturb much more than they interest or satisfy. We shall not be judged by what we could have done if things were different, but by what we did with the opportunities given to us.

In country districts problems are sometimes less difficult. Nature has a way of adopting the efforts of man and forcing them into her scheme of universal beauty, and unless they be very bad they lose most of their minor faults under her generous hand; but an ignorant and bad design remains an ignorant and bad design to the end of the chapter, and because we have much more freedom we have more responsibility. It is cowardice to say that nothing can be made of a building because little money is available. If we have enough to build well—and no architect ought to build ill—we must imbue our work with beauty of some kind or we are not artists. We can attain character and interest whether it be by the scholarly use of pure proportion or an artistic use of rambling outline and scrambled colour.

That which goes against the general attainment of beauty by our profession as a whole, so far as the design of more humble buildings is concerned, is the spirit—most heartily to be condemned—of a very commercial origin, in which the architect gets together more or less "stock" designs to fit all places and conditions and is too lazy and indifferent to face each individual problem which arises with the new interest it surely has. He mostly turns the matter over to an assistant, saying, "Just plot down something like that house for So-and-so," making a few rough notes of the different requirements and coming back when the pencil sketches are done, saying: "That is good enough for the job; *there is nothing in it.*" He excuses himself by asking, "Well, what can be done for a shilling a foot?" Much may be done at a shilling per foot even now if the "artist" is an *artist*, and has spirit enough to try. And this assuredly will be done: the architect will either prove himself a worthy artist or a mere money-grabber.

Problems are all so widely different that it is not possible, nor would it be desirable, to be dogmatic in detail. All depends on just the same subtle difference in temperament and spirit as lies between the two housewives and their two different homes—the one house often, too, a very poor one, where everything radiates brightness, freshness and fragrance; and the other, not always a poor one, where all is dull and musty and unattractive. One woman can make her poor home beautiful on a few shillings a week, while another, who lacks the interest and spirit and affection, can fail to do so on many pounds. What we as artists should do is, surely, to make our handiwork stand out in the same unobtrusive but delightful way, and we shall find the proof around us every day, as we can now if we look seriously for it—that it is the genius of the artist which counts.

The function of an architect is not merely to draw lines from which others can build, which indicate a house containing the various necessary parts. He should strive to imprint the highest impulses of our times upon the buildings set aside for their various purposes in the highest possible manner, and unless he attacks his problems sincerely in this spirit he will fail to attain the standard of beauty and usefulness which is open to us all.

THE GOTHENBURG JUBILEE EXHIBITION.

We have received from a correspondent the following notes on the buildings at the Gothenburg Exhibition, which we illustrate this week:—

The idea of commemorating the three hundredth anniversary of the foundation of the city of Gothenburg by the holding of a Jubilee Exhibition was already mooted a decade or more ago, and the actual work on the exhibition buildings and grounds has occupied some four or five years. Gothenburg is a rich city and possessed of the old Swedish spirit: if a thing is worth doing at all, it is worth doing well, without paying too much heed to the outlay involved. In consequence the exhibition has been very costly, both absolutely and relatively, but it has proved a complete success, and it will always keep its place in the record of such big shows.

Although the undulating site, with the solid rock showing itself in many places, lent itself admirably to a picturesque exploitation, with its slopes and terraces, it required a tremendous amount of putting into order, the permanency of some of the buildings of a necessity enhancing the difficulty of the problem. Everything was done to make the place beautiful; a huge pond was blasted in the rock, improving in the most effective manner some of the surrounding structures, more especially the Memorial Hall. The old trees found in the ground were preserved wherever possible, often in the most ingenious manner; decorative fountains and vases, ornamental shrubs, brought from foreign lands, abounded.

The two architects, M. Arvid Bjerke and M. Ericsson, were responsible literally for the whole scheme, but it goes without saying that they had a large and most able staff of helpers: architects, painters, sculptors, and other artists and craftsmen.

The exhibition was not really in the first instance intended to be a commercial fair; its purpose was more to show the high degree of excellence to which Swedish industries and crafts had attained, and how this had been gradually brought about. This also becomes manifest in the large industrial hall, an imposing structure, 200 metres long, breadth in one span 35 metres, and height 24 metres. The interior of this huge structure is entirely white, nothing but white, and the effect is very pleasing.

One thing at once strikes the visitor: of whatever type, the various buildings have been most skilfully placed; they and their location suit each without a single exception: one need only look at the elevated position of the Memorial Hall and its reflection in the pond beneath, or the semicircular colonnade with its wings of curving pergolas right against the water, or the massive dome of the main entrance, the high walls with the monumental arches, and the trees kept in their old place.

An imposing structure, admirably placed at the far end of the new Göta Square, is the art exhibition, a permanent, highly decorative building, Gothenburg's future art gallery or museum, and well adapted for its purpose. Of the two detached wings, the one on the right-hand side when facing the museum is also a permanent building, intended for the holding of art exhibitions, being designed for and having served as a gallery for modern Scandinavian art this summer. The interiors of the different buildings evidence the skill and artistic sense with which they have been designed and constructed. A singularly beautiful house is that devoted to Swedish crafts, a field in which the Swedes excel.

ENTRANCE HALL IN HANDICRAFTS' PAVILION.

Gothenburg Exibition.

CORRESPONDENCE.

Housing in Italy.

Sir,—In the *Times* of August 8 appears an ticle, by their Rome correspondent, on ousing in Italy. It explains the Italian post- r system of obtaining small houses in quantity, ich is summed up as follows :—

" Success in Italy has been achieved by the nt of a substantial annual subsidy in the m of (a) remission of taxation ; (b) by the ancing of building societies at a low rate of erest—2 per cent. to 3 per cent. ; (c) by a olute policy, at whatever cost in popularity, throwing the arrangement of the relationship ween landlord and tenant upon the first rties themselves."

As compared with our expensive complications d uncertainties, this system appears to be simple and common-sense one. Our pre-war tem of house building was one of private terprise financed on easy terms, backed by building societies with their loans for house rchase. It was our people's own way of getting ir homes. At the present time of uncertainty to future building costs the building societies not lend, on mortgage to a purchaser, a ficient percentage of the purchase price, and a consequence the builder must be content to ve a considerable sum, secured to him by a ond mortgage, sunk in each house he builds d sells ; he cannot continue to do so definitely.

Under a system of Government guarantees building societies would be prepared to lend most the full purchase price, or an amount ich, together with the purchaser's available h, would pay for the house. These loans uld presumably be made at about 5 per cent. erest ; they would relieve the builder of a eat burden and so free him to proceed with his ilding at a greater pace, and they would rmously increase the number of small house rchasers. Even better than this system would the financing of the building societies at tween 2 per cent. and 3 per cent. by Govern- nt loans, the societies' profit being restricted its present rate, for then the purchaser would paying no more in interest annually than he did pre-war days. On the face of it this proposal y seem absurd, but surely if it can be done a comparatively poor country it can be done Great Britain. In Italy the capital was vided by institutions which correspond to our st Office Savings Bank, and it seems very sonable that the people's savings should be towards assisting the building of the people's nes. To subsidise builders with cash sums the effect of raising prices of materials, but of wages ; this has been proved quite ently, and it looks as though it were now in cess of being proved again under the new .

There is, however, in this Bill, one hopeful . Section 5 (1) (b) empowers a local hority to guarantee to a building society the ayment of an advance made to any of its nbers desiring to build or acquire a house ing an estimated value of not more than 500. This clause looks something like the leus of a system of guaranteed house purchase, ch would not raise prices artificially, would enforce the acceptance of ninepence for pence on people who prefer to be independent uch gifts, and which would begin to provide required homes in adequate quantity. In it is the only system which can be per- ently successful.

he Italian system might be adapted to our housing problem without difficulty, and I convinced with economy and with as much ess as has been the case in Italy. It is ed certain that no efforts of Government can successful unless based on the old and well- d method of house building that existed for ng in this country before 1914. As to the that qualified architects might play in such heme, it will be recognised that a new eration of house builders is getting to work, that the Royal Institute of British Archi- s has already agreed with them upon a scale of fees to be charged by its members for this kind of work.

Arthur Welford.

Alabaster Panel in Long Melford Church, Suffolk.

Alabaster Panel " Visit of the Magi."

Sir,—I enclose a photograph representing an alabaster panel of the above subject in Long Melford Church, Suffolk, which, I think, shows such close similarity to the panel from Tresletham, Cornwall, in your last issue, as to afford strong evidence that these carvings were produced on something not greatly removed from modern commercial lines by the Derbyshire alabaster workers. My example is better preserved than the Cornish specimen, but the similarity of grouping, pose, and details of dress is as close as it is reasonable to expect in panels of slightly differing proportion.

Edwin Gunn.

Houses and House Agents

Sir,—I think it is only fair that you should know my experience of house agents and auctioneers in the matter of selling houses of recent years. The misdescriptions of these gentlemen are somewhat an outrage.

I read of one house, standing in its own ground, well back from main road, entrance hall, &c. I found it was just 17 ft. from road and the entrance hall was 3 ft. 8 in. wide by 10 ft. long. This is only one point, however. What of their methods of getting extra commission ? I have an instance of a working-man willing to sell a house at £475. He was visited by an auctioneer's " runner," who took particulars and said he could sell at once as the house was cheap. A few days later the owner was visited with a suggestion to sell the property at over £475, the auctioneer to have half the difference between the £475 and what he could realise for the property, in addition to his commission on the £475.

This house remained empty for many months, and at last someone, unable to find a dwelling, was obliged to pay £550 for the property, of which the auctioneer took £37 10s., plus his usual commission on £475.

E. Boulton.

[*** We have already stated our views on this subject, and the second case given by Mr. Boulton does not seem a business procedure to which much, if any, exception can be taken.—Ed.]

One-Way Point Traffic.

Sir,—Standing in the Mall outside the " Regal Circle," it seemed " plain as a pikestaff " that if all traffic were directed to the right, round the centrepiece, there would be less confusion.

I am aware that the subject was discussed, experimented on, and reported on adversely before the war ; yet the matter is so important that a fresh demonstration would still be instructive if arranged at the point referred to, especially as there need be little expense in the preparation for it there.

O. B. I. T.

The Parliament Buildings, Winnipeg.

Sir,—In your issue of September 28, under the heading Competition News, " New Offices, Holt Line," the statement is made that Mr. H. J. Rouse went to Winnipeg to make the working drawings of the new Parliament Buildings, Winnipeg, of which I was the architect. Mr. Rouse was a short time in my office in Winnipeg and worked on the drawings with other assistants. As the building cost nearly a million pounds sterling and took about seven years to complete, most of which I spent myself in Winnipeg, the foolishness of such a statement is obvious. I shall be obliged if you will insert this letter in your next issue.

Frank W. Simon.

[*** We received the information from a source which we thought ensured its accuracy. —Ed.]

Colouring Relief Carving.

Sir,—I should be obliged if either you or your readers could give me advice in the following matter. I desire to stain or colour low relief carving in mahogany. The subject is the usual fruit and flowers, and the height is eye level. Any information as to method, and where examples can be seen, or the name of any artist in this material, would be most welcome.

C. Roche.

The Utilisation of Waste Materials for Making Building Materials.

Sir,—In connection with my lectures at the Royal Academy of Arts this year I propose lecturing on " The Utilisation of Waste Materials for the Making of Building Materials." I am already in possession of a good deal of interesting information under this head, but the subject is such a wide one that there may have been interesting experiments in this direction with which I am not acquainted. I should appreciate very much, therefore, if there is anyone among your readers who would care to supply me with any further information on this subject. I cannot, of course, promise in the course of a short lecture to utilise all the material with which I may be supplied, but will, of course, acknowledge the source of any information which may reach me and which I decide to utilise.

A. P. Laurie.

Heriot Watt College,
Edinburgh.

THE COMPLEAT ARCHITECT.

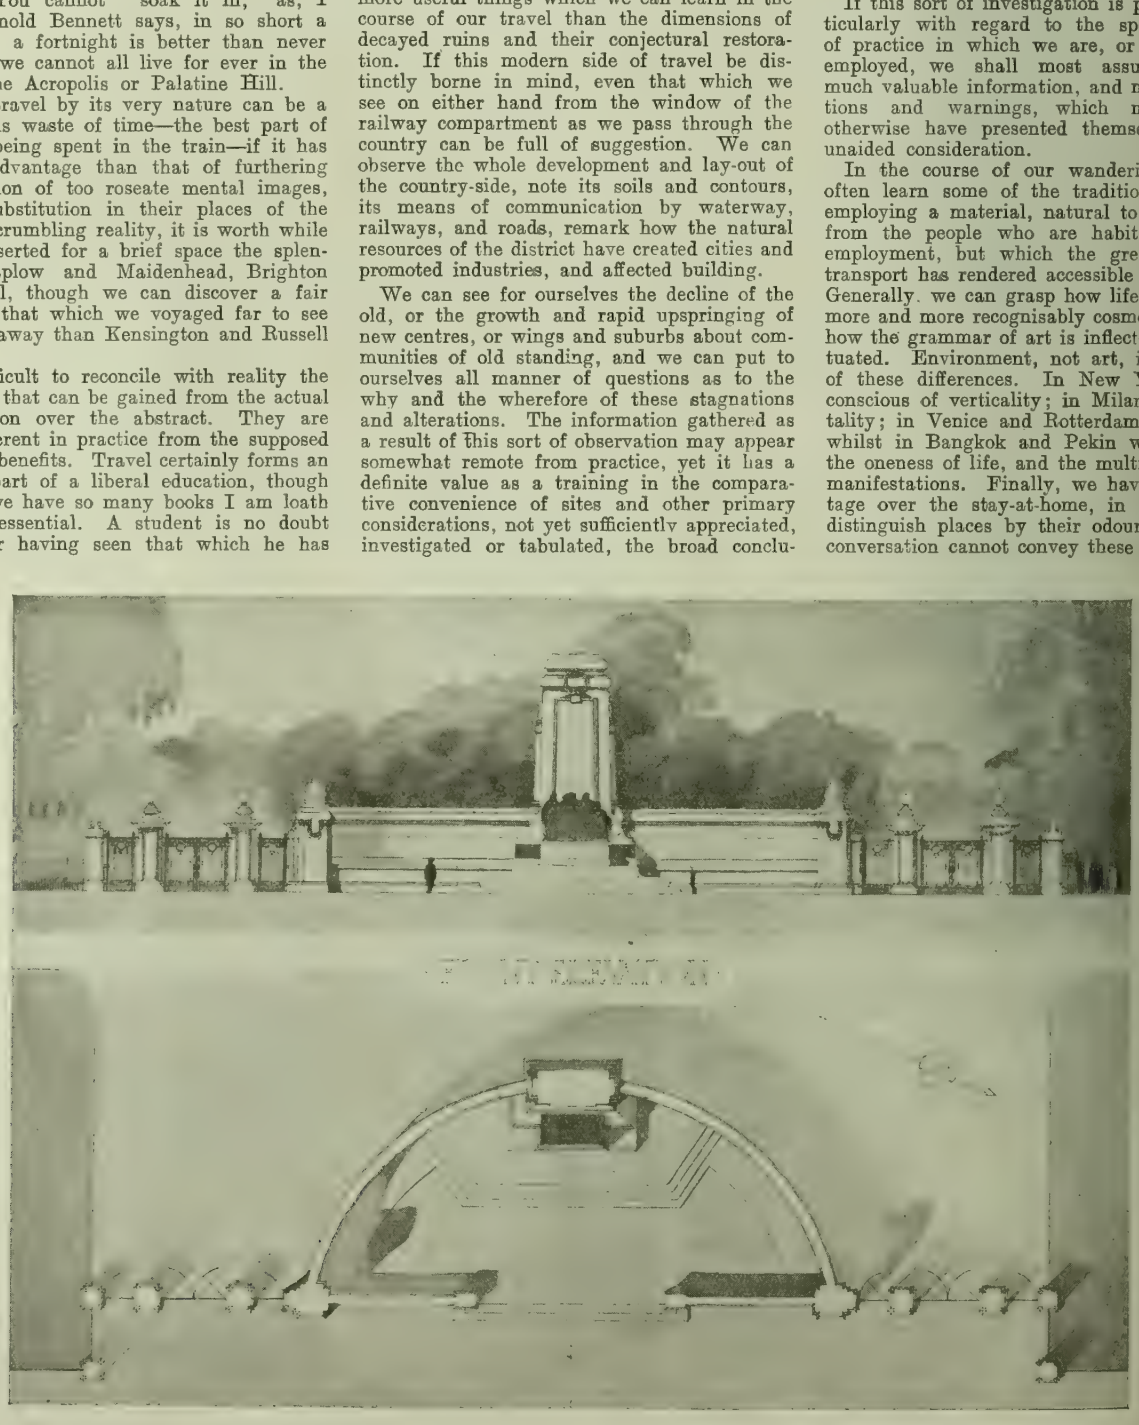
By DUDLEY HARBRON.

IX.—TRAVEL.

"Anybody can travel nowadays by conducted tours," remarked a crusty English gentleman to the writer, in a foreign port. He intended that his remark should convey a sense of superiority, having doubtless taken up his residence abroad in order to live on a depleted income at a favourable rate of exchange. I agreed. None the less, a great deal of superior nonsense has been spoken about the value and importance of travel. Men dash across the Atlantic, and tour through the Continent of America in Pullman cars for a week or two, and then come home and write books about the American people; or they spend a week in Rome or Paris doing the sights, and for ever after they can be told nothing they do not know about those two capitals. You cannot "soak it in," as, I believe, Arnold Bennett says, in so short a time. Yet, a fortnight is better than never at all, for we cannot all live for ever in the shade of the Acropolis or Palatine Hill.

Though travel by its very nature can be a most tedious waste of time—the best part of a holiday being spent in the train—if it has no other advantage than that of furthering the correction of too roseate mental images, and the substitution in their places of the faded and crumbling reality, it is worth while to have deserted for a brief space the splendour of Taplow and Maidenhead, Brighton and Bexhill, though we can discover a fair amount of that which we voyaged far to see no farther away than Kensington and Russell Square.

It is difficult to reconcile with reality the advantages that can be gained from the actual contemplation over the abstract. They are widely different in practice from the supposed theoretical benefits. Travel certainly forms an advisable part of a liberal education, though now that we have so many books I am loath to call it essential. A student is no doubt sounder for having seen that which he has read about, because actual observation conveys at a glance and impresses the mind more surely than can with confidence be assumed to have been assimilated from the reading of quite a number of books. Still, altogether too much has been made of the need to visit Greece and Italy; it is time some progress were made, and Paris and New York, say, put forward as possible substitutes. Nor need the unfamiliar parts of Great Britain be ignored. For I believe it will be agreed that the chief impression received by a sensitive traveller upon viewing the remains of the ancient world is one of distress and dismay. We realise how many feet of dust have overlaid the past, and how remote from ourselves it is.



But, if we are observant, there are many more useful things which we can learn in the course of our travel than the dimensions of decayed ruins and their conjectural restoration. If this modern side of travel be distinctly borne in mind, even that which we see on either hand from the window of the railway compartment as we pass through the country can be full of suggestion. We can observe the whole development and lay-out of the country-side, note its soils and contours, its means of communication by waterway, railways, and roads, remark how the natural resources of the district have created cities and promoted industries, and affected building.

We can see for ourselves the decline of the old, or the growth and rapid upspringing of new centres, or wings and suburbs about communities of old standing, and we can put to ourselves all manner of questions as to the why and the wherefore of these stagnations and alterations. The information gathered as a result of this sort of observation may appear somewhat remote from practice, yet it has a definite value as a training in the comparative convenience of sites and other primary considerations, not yet sufficiently appreciated, investigated or tabulated, the broad conclusions of which should be applied in the development of unexploited parts of the world.

When we alight at our destination the railway station and its convenience will not escape criticism. We can study the methods employed to collect and distribute commodities, the situation of and the classes and processes of manufacture; the hewing, mining, and handling of raw materials; the marketing and display of commodities; and this embraces also the fascination of shopping without the expenditure of money. Nor should the extent and convenience of the public services be taken for granted and escape our notice—the parks, the libraries, the water service, the lighting, the roads and tramways; the amenities—i monuments and galleries; the administratio of justice; the modes, methods, and signific ance of worship; the recreations of the citizens—in theatre and public places; all th many coloured aspects of life, under a differen clime, but which has many aspects an problems similar to our own.

If this sort of investigation is pursued, par ticularly with regard to the special branc of practice in which we are, or hope to be employed, we shall most assuredly obtai much valuable information, and many sugges tions and warnings, which might neve otherwise have presented themselves to ou unaided consideration.

In the course of our wanderings we ca often learn some of the traditional ways o employing a material, natural to the district from the people who are habituated to it employment, but which the greater ease o transport has rendered accessible to ourselves Generally, we can grasp how life is becomin more and more recognisably cosmopolitan, an how the grammar of art is inflected and punc tuated. Environment, not art, is the sourc of these differences. In New York we ar conscious of verticality; in Milan of horizon tality; in Venice and Rotterdam of the sea whilst in Bangkok and Pekin we appreciat the oneness of life, and the multiplicity of i manifestations. Finally, we have the advan tage over the stay-at-home, in that we ca distinguish places by their odour; books an conversation cannot convey these distinctions

Design for the Guards' Memorial By Mr. W. T. Curtis, F.R.I.B.A., and Mr. John Tweed. (*See p.* 525.)

St. Peter's Church, Bradwell-on-Sea.

EXHIBITION NOTES.

THE GIEVES GALLERY.

We are glad not to have missed the poetic ork of Mr. Henry T. Wyse at the Gieves allery. His paintings and pastels (and the o media are often merged together) show a e sense of colour value, breadth and unity of ect, and a varied outlook both as to subject d treatment. "Trees in Autumn," "Summer ouds," and "Evening in Early Summer" ve a telling feeling of softness and mystery, ilst in his "Peat Moss and Cloudy Sky," ere the form is more definite, we have a arming picture of colour and light. "By e River" is a perfect piece of its kind, with a h glow of golden light. It is to be hoped that fore long we shall see another collection of . Wyse's work. The examples of pottery, W. S. Murray, R. F. Wells, and Henry T. yse, exhibited with the above-named pictures, ow that modern pottery of great excellence being produced. Refinement of form and cellence of texture and colour are apparent these pieces.

THE ALPINE GALLERY.

When one has got accustomed to look for e traditional style of painting, it is not easy first to realise the full values of the kind of ork to be found in the collection of paintings Mr. Frank Morse-Rummel; but on looking refully through the forty-six exhibits one alises how considerable is the charm of colour d what strong individuality of character are re to be found. Nos. 33, 29–23, 19, 24, 26, d 36 are passages of vivid and beautiful lour, whilst in No. 8, a picture of Lapp women, have combined a telling picture of the ghly characteristic and brilliant costumes of e people in a delicious setting of mountain d lake. We have in these pictures a vivid alisation of the characteristics of a far-away nd, and one feels compelled to wonder what e painter would do in regions familiar to us all. yone who can paint like this should be pable of great experiments.

THE FRENCH GALLERY.

From the admirably vivid "Study of a Man" pencil by W. Rothenstein (1) to the beautiful ture of "Northern Seas" (113) by G. Munthe, have a range of pictures and drawings of ch interest at the French Gallery (118th hibition). Brangwyn's "Orange Market, fa" (47) is one of his rich golden pieces which have seen before. The "Spring" (53) by C. ns is full of poetic life; the "Belated" (41) l "Returning to the Fold" (52) are two of Stott's best; whilst Lhermite (38), W. G. Glehn (46), Hornell (50), Lavery (54), and nder (102) give us of their best. There are admirable little water-colours by Harpignies and 37), and a beautiful little Diaz (10), lst H. B. Brabazon will delight his admirers a number of dainty water-colours. The whole hibition is an exceptionally interesting one.

AN ESSEX EARLY ANGLO-SAXON CHURCH.

We had the satisfaction of bringing to the notice of our readers recently some particulars of an interesting Anglo-Saxon church far away in the North. We can now offer them a view of one equally obscure, much nearer London, that may be compared with the one already described. In the parish of "Bradwell near the Sea," sometimes styled "Bradwell-on-Sea," about twelve miles east from Maldon, and about fifty miles from London (the church of which is dedicated to St. Thomas the Apostle), stands a little chapel dedicated to St. Peter by Cedd, the second Bishop of London (A.D. 654–666), who had been appointed to that see by Sigebert, King of the East Saxons, according to Bede. Old historians consider that the Saxon City of Ithancastra stood at or near this place, and that it is identical with the Roman Station of Othona, where the "Numerus Fortensium," under command of the "Count of the Saxon Shore," was established in the decline of the Roman Empire. The parish lies at the mouth of the Blackwater River, which forms its northern boundary, the North Sea lying to the east, near to which are the remains of the ancient chapel used as late as 1833 as a barn, but now rescued from lay uses, rededicated on June 22, 1920, and repaired; but the ancient rough condition has been preserved, as will be seen from the accompanying illustration, clearly showing the courses of the roughly-worked stones, the original window high up at the west end, the peculiar finish of the angles of the west wall, the blocked doorway of the north wall, the courses of Roman tiles or bricks towards the top of the wall, and other interesting Saxon features. The year 653 is assigned by antiquaries as the actual date of its erection. An annual pilgrimage to this venerable relic takes place under the auspices of the Essex Archæological Society, a proceeding which might very advantageously be adopted in regard to other ancient historic buildings for keeping them before the minds of their possessors as worthy of preservation and fostering a loving care for such valuable memorials of past ages. It is remarkable that neither Parker nor Bloxam have made any mention of this Saxon edifice in their classic works on the ancient architecture of our churches, which for its extreme simplicity, its well-established antiquity, and its instructive details, has rightly merited considerable notice, hitherto overlooked.

From a Sketch by Mr. Walter Millard.

New Paper Mills at Kemsley, Sittingbourne.

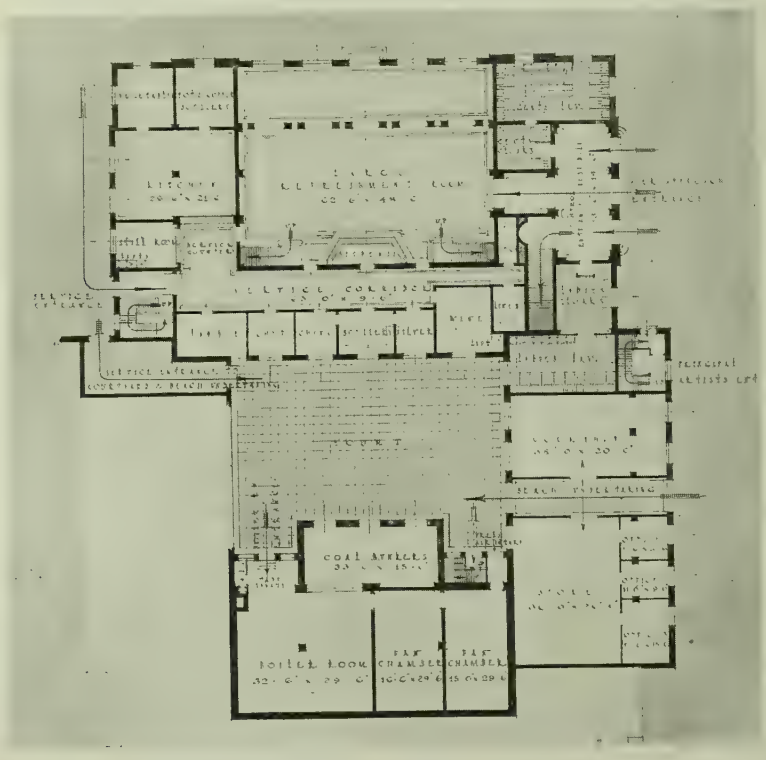
The illustration shows the main entrance front of this building, now in course of erection for Messrs. Edward Lloyd, Ltd. The mills are a one-story building of steel-frame construction, the external walls being of Kentish stock bricks with a blue brick base. The roof is of steel trusses filled in between with reinforced concrete asphalted on the upper surface, with roof lights.

The building generally has been designed by Mr. A. A. Richards, engineer to Messrs. Edward Lloyd, Ltd., the elevations being designed by Mr. T. F. W. Grant, F.R.I.B.A., 11, Buckingham-street, Adelphi, W.C.2, and is being erected under the supervision of Mr. W. Leonard Grant, Sittingbourne. The contractors are as follows: General contractors, Messrs. E. Bishop & Sons, Sittingbourne; steelwork, Messrs. Redpath, Brown & Co., Ltd.; artificial stone, Messrs. Malcolm Macleod & Co., Ltd.; roof glazing, Messrs. W. H. Heywood & Co.; steel sashes, Messrs. Henry Hope & Son, Ltd.; asphalte, Limmer & Trinidad Lake Asphalte Co.; stock bricks, Messrs. C. Burley, Ltd.; Portland cement, Messrs. Smeed, Dean & Co., Ltd.; reinforced concrete roof, Trussed Concrete Steel Co., Ltd.; sewage filter beds, &c., Messrs. Tuke & Bell, Ltd. "Hy-rib" reinforcement (supplied by the Trussed Concrete Steel Co.) is being used to the extent of over a quarter of a million sq. ft.; this material eliminates the necessity for using close-boarded shuttering.

Bournemouth Pavilion Competition.

We illustrate a design submitted in this competition by Messrs. Easton & Robertson & V. O. Rees. The essence of the scheme consisted in the arrangement of the concert hall, with adequate supervision of its exits and entrances, combined with a grouping of the latter so as to provide access either to ground level or to the amusement group consisting of tea-room, lounge, &c.

All the latter rooms are arranged to have exterior view, and no corridors pass in front of rooms. All rooms and services have proper and adequate lighting. An ample stage for all purposes is provided, a special setting for concert arrangements, and planning throughout is simple and direct.



We published the premiated designs in our issues of July 6 and September 7.

Union Building, Armstrong College.

Messrs. Cackett & Burns Dick, FF.R.I.B.A., of Newcastle-on-Tyne, are the architects for Union Building, Armstrong College, Newcastle-on-Tyne.

The Guards' Memorial.

The design for the Guards' Memorial was submitted by Mr. W. T. Curtis, F.R.I.B.A., architect, and Mr. John Tweed, sculptor, in the recent competition.

Bournemouth Pavilion Competition.

Design submitted by Messrs. G. Murray Easton & Howard Robertson, V. O. Rees.

St. Mark's Church, Layton, Blackpool.

The new church of St. Mark's, Layton, Blackpool, will be cruciform in plan, having north a south transepts, nave with north and sou aisles separated by arcading of semi-circul arches and circular columns, and a well-light chancel terminating at the eastern end with apse. A lofty arch divides the nave a chancel, and an almost similar arch divides t nave and western nave, designed to receive gallery at a future date, if required. The tow rises from the south transept, and will conta a ringing chamber reached by a spiral sto stair, clock chamber (three dials) and belf (peal of eight). The organ is placed faci towards the chancel and the north transept, a as the transept will be carried up to the heig of the nave roof the instrument should be hea to full advantage. Choir and clergy vestr are conveniently placed on the south side of t chancel communicating with each other and a with the chancel and south transept.

The principal entrance leads into the sou aisle at the western end, on the left of which placed the font. A second entrance is by w of the north transept. A clerestory a windows in the aisle walls give ample light the interior. The timber roof will be of bar formation.

The site has presented many difficulti mainly by reason of its narrowness and contiguity with an eastern main approac the architect has, however, sought to bri into prominence the more potent features of t church by placing the massive tower as illu trated, thus also balancing the various co ponents in group formation, and by keepi the roof of the vestries at a comparatively l level so to give the best prospect of the wh fabric from Westcliffe-drive.

The new church has been designed on Norm lines throughout.

The architect is Mr. Edgar Dennis, of Blac pool.

Abbeydale Golf House, Sheffield.

The plans of this golf house are the co petition drawings which were placed first a recent limited competition, the assessor of wh was Mr. W. Herbert Fowler, of London. T erection of the building has been commenc Messrs. J. Eshelby & Sons, of Sheffield, be the contractors. The materials to be used stone base to walls with roughcast over, gr and rustic Delabole slates, iron casements wood frames, and leaded lights.

The plans are being slightly varied in exe tion to allow a card and reading room to placed on the first floor in the position sh for the steward's rooms, and a large ingle place is to be added to the smoke room.

The architects are Messrs. Chapman & J kinson, of Sheffield.

THE BUILDING ART: THEORIES AND DISCUSSIONS.—X.

By W. R. LETHABY.

LATER BUILDING MASTERS AT WESTMINSTER ABBEY.

When Henry III died in 1272 the old Norman nave remained attached to the new choir (west of the crossing), transepts, and eastern limb. He must have had the intention of rebuilding the whole church, for in the bay of the cloister, just west of the general termination of his work, may be seen (although I do not think its evidence has been considered) the beginning of another bay of the wall tracery of the cloister. This tracery was afterwards cut away, but it shows that it had been intended to continue the thirteenth-century work. Almost certainly plans of the completed church had been made by the first master mason. The work executed before 1272 had been done in two separate portions, and King Henry would not have been content with an incomplete scheme. When in the second half of the fourteenth century the rebuilding of the nave was undertaken, the general design of the thirteenth-century portion already built was maintained, and I have little doubt that the intention was to complete King Henry's plan. It is even probable that foundations had been put in for some distance beyond the point just mentioned, for when the cloister was rebuilt (earlier than the nave) it was very accurately planned in regard to the work which was to follow. The flank walls of the Norman nave were, I believe, far enough within the line of the new walls to allow of this; in any case, the piers of the flying buttresses were entirely free. In the interior the thirteenth century work terminates with ordinary piers and responds; there is nothing like a linking up with earlier work to the west. It was Scott's view that the Norman church consisted of two parts, the Confessor's work to the east and a late Norman continuation to the west, and that Henry III rebuilt the Confessor's part. Dean Robinson has shown that there is reason to believe that the Confessor built the entire church, and the building itself is evidence that it was King Henry's intention to rebuild the whole.

After the King's death, however, the royal work ceased, and minor works and repairs, except royal tombs, were done by men on the Abbey staff. When the completion of the church was undertaken I have little doubt that it was on the general lines of the plan of the thirteenth-century master.

In 1342 Walter Le Bole was Abbey mason, receiving dress and food. In 1349 his will was proved; this was the year of the plague, when the abbot and about half of the monks died. To Walter Le Bole we doubtless owe the beautiful eastern bays of the cloister. It was found by the late Mr. Rackham in his examination of the fabric rolls at the Abbey that John Palterton was master-mason from 1349 to 1373–4. The south and west walks of the great cloister, begun about 1352, would thus appear to have been his work. In some special way it was undertaken by Litlyngton while prior, for his initials are known to have been on the boss of the third bay from the entry, and in "Neale" it is said that the abbot's arms were also on a boss at the east end of the cloister. Here there is still trace of an armorial boss. In 1352 stone was bought "for the work of the Prior in the cloister." The entry was built in 1362, and in this year a new cymbal for the cloister was made; this is now in the Museum. The cloister was finished in 1365.

From 1364 the Infirmary buildings were rebuilt by Palterton. While engaged on this work he was paid two shillings a week, with his daily commons of bread and beer, and received a fee of forty shillings in addition. The most significant part of the Infirmary building which remains is the doorway in the little cloister. It is a good deal like a door once in St. Stephen's Chapel, and is a very graceful work, having a row of quatrefoil up the jambs and around the arch. The capitals have little tufts of foliage set against the bells rather than springing from them. The drip-mould terminations are angels' heads—very pretty (Fig. 1). Mr. Westlake

Fig. 1.

says: "In the roll for the year 1371–2 there is the record of taking down the older stone doorway and making the present beautiful entrance." This precise record is valuable, for the character of the work seems earlier than the great cloister, and I am drawn to think that Henry Yevele, who is named as one of six chief masons of London in 1356, may have been concerned with the design of the cloister. In any case, Yevele was the master of the work in building the new nave, and the cloister may well have been planned in connection with that. The south-east angle bay of the cloister and the vaults of the two compartments north of it in the east walk might be by a different master than the rest.

In 1375 the wall of the Norman nave next the cloister was destroyed. Palterton's name does not appear after 1373–4, and from about this time Yevele is likely to have been engaged in the important new work. He is known to have made the tomb of Cardinal Langham, who died in 1376. It is not improbable, indeed, that he was chief adviser at the church from the time of his appointment as King's mason in 1360 or even earlier. Dean Robinson thinks that it may not be doubted that Langham (abbot from 1349) determined to rebuild the Norman nave and he left the Abbey in 1362. Now the western walk of the cloister, which was finished in 1365, is so accurately adjusted to one of the nave buttresses that its position must have been accurately known at that time; moreover, the west and south walks of the cloister seem to be in the style of the nave. Compare especially the doorway from the west walk to the nave with the arch over the recess in the same west walk. Close scrutiny of the work has convinced me that when in the Roll it was stated that the cloister was "finished" in 1365 it was indeed *complete*, including the three bays against the nave. The design of the west and south walks follows from the north-west pier and that must have existed before they were undertaken. The vaulting of the bays is also of an early character, yet it has been supposed that this work followed on the taking down of the Norman wall of the nave in 1375.

Five windows of the new nave were ready for the ironwork in 1388–9. The earlier accounts of the work are missing, but that of the year before includes the "Fee of Master Yevele, chief mason, 100s. per annum, and for his and furs, 15s.; Do. of Robert Ken 13s. 4d.; tunic of Thomas Padington, In 1375 Kentbury had a tenement in minster, and he was probably already Y lieutenant. The account of 1388 inclu small item for breaking down the walls old church, and this appears, as Mr. Rac remarks, to have been the last entry for down the old walls. All or most of the piers of the nave were built by 1400 (Rack The nave, except for the west front, is tinuation of the thirteenth-century bui but the west front was newly designe has been so much injured by Hawks changes and hidden in the interior by masonry that it has not been recognised fine fourteenth-century work which it esse is. The window at the west end of the aisle is still *original work*, although the windows along the flanks have been re on the exterior at least. This precious w is of fourteenth-century form, and the quatrefoil has the upper lobe larger tha rest, which gives it a touch of energy. narrow limits it must be as early as any new work. The porch with the niche either hand are still largely original. niches have delicate "vaultings" to canopies. The niches of the upper tier dealt with by Hawksmoor, but they represent what was there. They pro contained statues of kings; over them shields of arms. The porch and surrou work is closely like Yevele's porch at minster Hall.

The great west window, as may still be on the interior, must have followed the design of the front, although its executio delayed; the mullions and transomes with the lines of the wall-panelling, and scheme of wall-panelling starts from the level. The window closely resembles th windows of Westminster Hall and, like must have been designed by Yevele; i not finished until Abbot Esteney's time 1474). There is a record however that was obtained for the chamber over the porch in 1442 (Rackham), and the ma must have been carried well above its when this chamber was roofed.*

The exterior also has tiers of wall-panelling following from the tracery of the west window, and I reach the conclusion that the whole front was carried on according to the design of Henry Yevele.

On examining the indications on the interior of the front it will appear that it was conceived as panelled throughout with strong vertical strips rising from the plinth level, crossed by horizontal bands, knitting door, window and wall together (Fig. 2). The inner arch over the door has the same moulding as the greater mullion strips which are continued below the west window. These greater mullion strips indeed framed in the doorway, which formed one large panel in the general "all-over" sche the interior. Above, on either side of th dow, the heads of the wall tracery show what the transomes of the lights were.

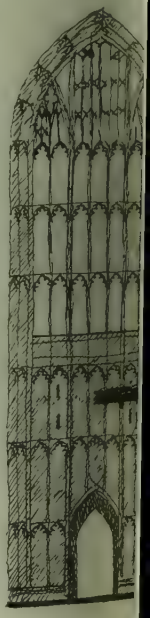

Fig. 2.

* John Pache was Abbey carpenter at thi and he was followed by Robert Pache. Th "Pache's house" lasted till the Dissolution (Rac

erted tracery arch directly over the ch of the doorway. The lower part of rior is represented by an engraving in s "Gothic Architecture," and the old is shown from within in Sandford's ation of James II," while the exterior in Hollar's view. Now the west front hester Cathedral is conceived in the ay, inside and out, and its west porch very similar to that at Westminster. t of Winchester appears to be the work William Wynford who, as said below, rking with Yevele in 1370, and we see Yevele's influence throughout the the Cathedral.

est front at Winchester was built by Edington in the last quarter of the four- entury. Willis says: "The design of window is singularly simple, reducing the merest stone grating. Divided into principal monials, each of these is o three by secondary monials. The n scarcely be said to be filled with so completely does the grating-like r pervade it; in the central group of ne grating extends to the very top." k of the nave was continued from the by Wykeham, who, in his will, dated rote: "I will and ordain that the ment and conduct of the new work entrusted to Master William Winford others, discreet, sufficient and approved art, as may be chosen if necessary." ription of the window might stand for Westminster Hall, and for that of the xcept that it had seven lights. At Win- have the front was built first and the eeded eastward; to some extent this ve been the procedure at Westminster Bond's "Westminster Abbey").

. 2 I give a rough diagram of the f the interior of the west front, from will be seen at once that it must have mpleted from the scheme begun in the urses. (The upper sill of the windows robably be omitted as having been Hawksmoor.) Fig. 3 shows more or

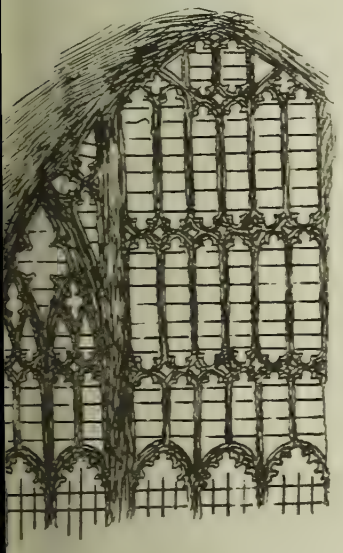

FIG. 3.

the window was like. Besides the s and parallels just mentioned, the the porch, which is "Perpendicular" ter notwithstanding earlier survivals, in reconstructing the window. For the transome bands in the tracery window were similar to those in the tcery. Another piece of evidence for y carrying out of the one scheme in front is to be found in the tower win- ich answer in position to those of the and the clerestory. On the interior clerestory window in the wall of each l the original intention was doubtless that these should receive light from the tower windows as in foreign cathedrals and at York.

Besides the advanced "Perpendicular" character of Yevele's work, an interesting technical point must be mentioned. He had a liking for big facing-stones, 16, 18, or even 24 ins. high and 3 ft. and more long. These stones are set with fine flush joints of white lime. Workmen never raked out joints to prepare them for stone-rot until they were instructed by architects of the sham Gothic "style." Some of the original Purbeck paving of the nave may be traced here and there, and the arrangement in strips is clearly indicated on the lithographed plans of the graves made about 1860.

. . . . . .

Considering the importance of the Abbot's House, the date at which it was built, and the way in which its plan interlocks with the west end of the church, so that the house could not have been set out before the nave, we may hardly doubt that Yevele was the architect of both. In Dean Robinson's account of "The Abbot's House" (1911) he has a section entitled "An earlier building on the site of Jerusalem chamber." Of this conjectured building, he thought, a part had to be pulled down in order to make room for the south-west tower; but the western half was saved and renamed as the "*nova camera* of the Abbot." I cannot agree with this view, for the adjustment of the walls of the chamber with the west end of the nave and its right-hand buttress is so accurate that the chamber could only have been built with or later than the foundation of the west front. Moreover, the foundation of the south-west tower must spread far under the chamber wall. I will now quote from Dean Robinson the historical facts regarding the building of the chamber. "From 1362 to 1365 work is going on above the entrance to the cloister; . . . the cloister was finished in 1365. The roll for 1369 is missing, but for nine years after that payments are made for what is called *novem edificium*. In 1371–2 canvas is bought for the windows of my lord's new camera and there is no doubt that Jerusalem chamber is here referred to. After this the Abbot's hall was built, and in 1375–6 it was so far finished that John Payable was putting in the glass, of which a fragment bearing the initials N. L. still remains. This work of reconstruction was completed some three years before the old [Norman] nave was pulled down; and we may perhaps assume that the extent of the new nave and its western towers had already been carefully calculated."

The traceried windows of the Abbot's hall and chamber are still original within, although they were completely refaced some thirty years ago. The roof corbels of the hall are very fine indeed. They are of angels holding shields, two of which have the Despencer arms, two others have the same with the "difference" of a bordure set with mitres for Litlyngton, and the fifth and sixth bear the arms of the Confessor and the Abbey. (There are similar large corbels in the ruined Refectory, and the alteration of this great chamber may also be Yevele's work.) The Abbot's hall has a fine roof and screen, and these I would assign to Master Hugh Herland, who later made the roof of Westminster Hall. Some spandrel fillings in both are alike. Those of the tomb tester of Queen Philippa (1369) are also similar, and this being a Royal work was doubtless done by the King's carpenter. The central trusses of the hall roof have been injured by having the arch and spandrel pieces removed (about Wren's time), but they remain against the walls and the roof is original except for wall pieces and struts put in place of the removed tracery. In the combination of moulded arches and tracery spandrels the roof is the prototype of that of Westminster Hall, and it may be that the great shield-carrying angels of the latter were suggested by the carved corbels of the Abbot's hall.

Of the glazing by John Payable four or five fragments remain. Two windows have the initials N.L. with a coronet above in the upper quatrefoils of the tracery. A third window retains the head of a little saint's figure in one of the other quatrefoils, and it is evident that initials and saints were in all the windows (Fig. 4). Payable must have been the best known glazier of his time, for in 1362 he had

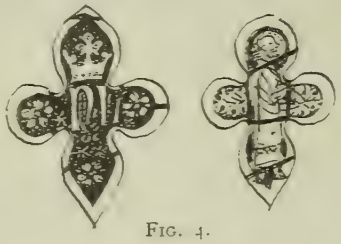

FIG. 4.

reglazed the great South Rose of the church. Litlyngton liked to sign his good works. The first boss of the vault of the cloister entry also has coroneted initials within a collar surrounded by a hunting scene (Fig. 5). The abbot had much pleasure with his falcons and his harriers,

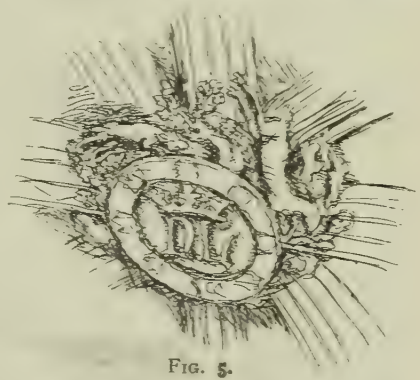

FIG. 5.

one of which had the nice name of "Sturdy." The second boss has the Despencer arms; another has four lions' heads, and the minor intersections have roses—the lions and roses of England.

I call attention to the "topical interest" of the details as leading up to the identification of several carved heads of label terminations of the doorways. Two (Figs. 6 and 7) are a king and queen. These should be Edward III and Philippa, as the cloister entry was built in 1362–4. Two other heads are of younger

FIG. 6.

FIG. 7.

Fig. 8.

royalties, doubtless the Black Prince and Joan, to whom he was married in 1361; the prince's head is well preserved, and one might think interesting (Fig. 8). A third pair of heads is of an abbot—obviously Litlyngton (Fig. 9)—and apparently a layman who might be the mason.

The custom of carving portrait heads of kings and craftsmen has never been worked out. In the north transept of the church there is a perfectly preserved marble head of a king, which must be Henry III, while higher up is a head which, I believe, is that of his master-mason. Outside the door from the church to the cloister are two crowned heads, and there are several other portraits. At St. Albans are a king (Edward III?) and queen, an abbot and a master-mason.*

In the Angel Choir at Lincoln is a series of fine portrait heads. At Exeter Cathedral there is an important mason's head, and there are several more in other places. At Southwark Cathedral are some important heads at the crossing which, if they are authentic, should be recorded; the king looks like Edward I. In certain Continental churches heads of the craftsman type have long been identified as master-masons and crowned heads as definite portraits. Such heads, when found in significant positions,

* I find that Mr. Page in his "Guide to St. Albans' Cathedral," says that the part of the nave where the heads are was begun by Abbot Hugh after 1323, and was completed by Abbot Mentmore (1335–49). "The easternmost is the head of a bishop or abbot (probably Hugh), next is a queen (probably Isabella), thirdly a king (Edward), and the last is probably Master Geoffrey, master-mason and surveyor of the works to Master Hugh."

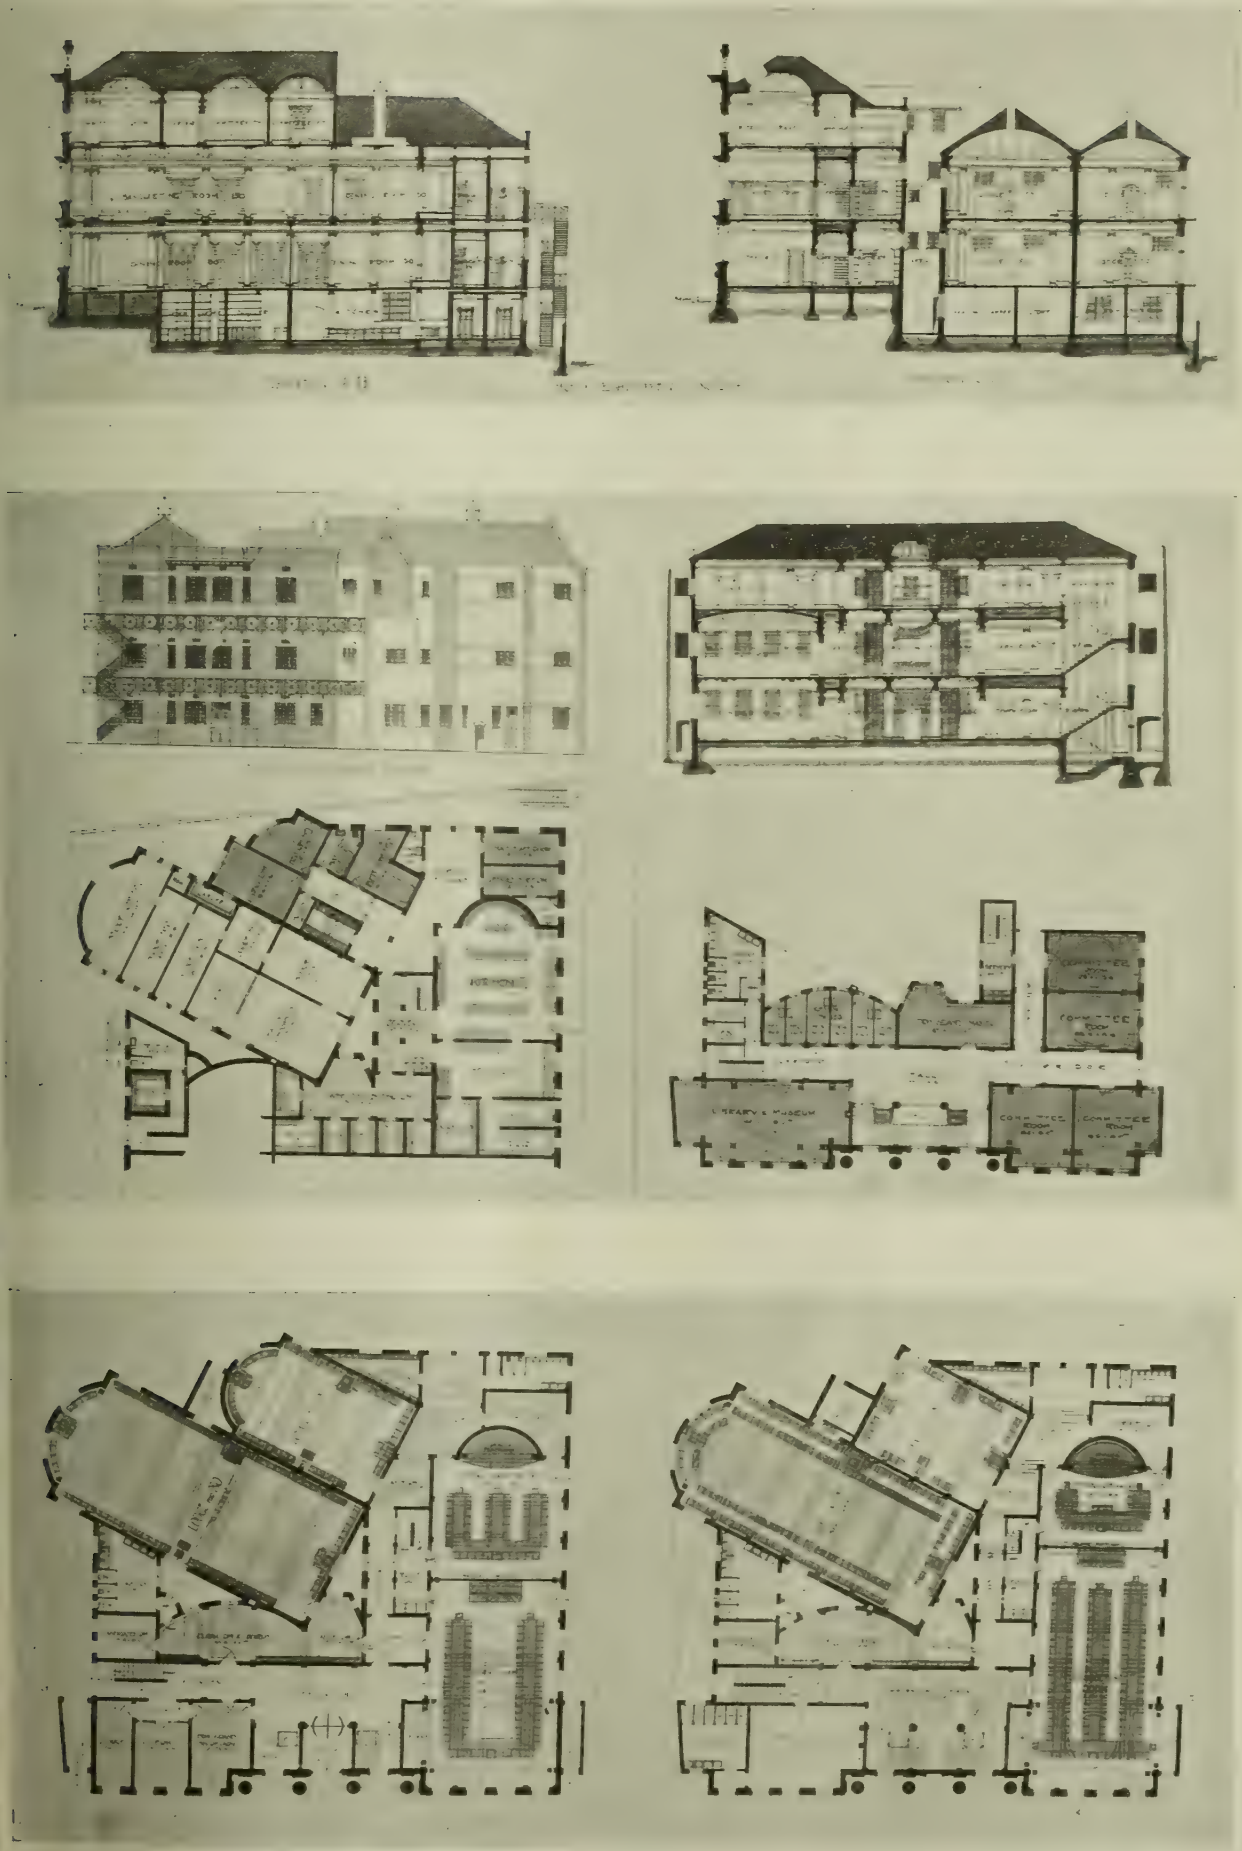

Fig. 9.

must represent particular persons, and i latter part of the fourteenth century portr was a special interest.

(To be concluded.)

HOUSING AND THE RENT ACTS.

At a recent meeting of the Property Owners' Protection Association, Sir Kingsley Wood is reported as having said that the Rent Acts could only be ended if there were vastly increased housing accommodation, and the meeting seems to have assumed that this was a fact, and to have discussed the means of increasing housing accommodation with a view to removing the need of further rent restriction. We venture to suggest that there is a fallacy in this somewhat dangerous argument.

That it is desirable by every possible means to increase the number of houses as quickly as possible no one will deny, but that the sufficient provision of accommodation must be a condition precedent to the repeal of the Rent Acts is a proposition we cannot accede to. The Rent Acts have created a privileged class. When rent restriction was first inaugurated this was comparatively a small class, which has been somewhat increased by the subsequent Rent Acts, but since the Acts were extended to more numerous houses there has been one element which has operated steadily to lessen the number of protected persons, for every new house erected since April 2, 1919, and every house converted into two or more separate and self-contained flats, has been outside the Rent Restriction Acts. Thus the protected class has steadily diminished ever since the last extension of the Acts, whilst the number of persons who have to face taking a house on unrestricted terms has steadily increased.

Is this process to be continued until every person is housed, and if so on what logical basis can this continued protection of an annually decreasing number of persons be justified, and what is the connection between the protection of this diminishing class and the provision of houses? Since April, 1919, an enormous number of houses have been built, and the successive Ministers have dwelt upon this fact with satisfaction. According to Sir Kingsley Wood, the rate at which houses can be erected has been accelerated so that now 100,000 houses can be erected where three years ago only 40,000 could be put up in the same time. How long is it going to be considered reasonable to offer those houses on unrestricted terms, whilst an arbitrary restriction on houses erected before April 2, 1919, is continued? Is it not obvious that in the protection of an ever decreasing class of persons the building of new houses and their occupation on sound economical terms is being seriously checked and hindered?

The Rent Acts not only favour one class but the restriction must be based on a stationary population, for the younger members of the community must seek new houses, although they can less afford the unrestricted rents than the older generation which has made its way, but the Acts also interfere with the market in house property and the well-established relationship of landlord and tenant. In all but very small properties that relationship has, in fact, been put an end to, for houses are not offered on lease and those who cannot become owners can have no home.

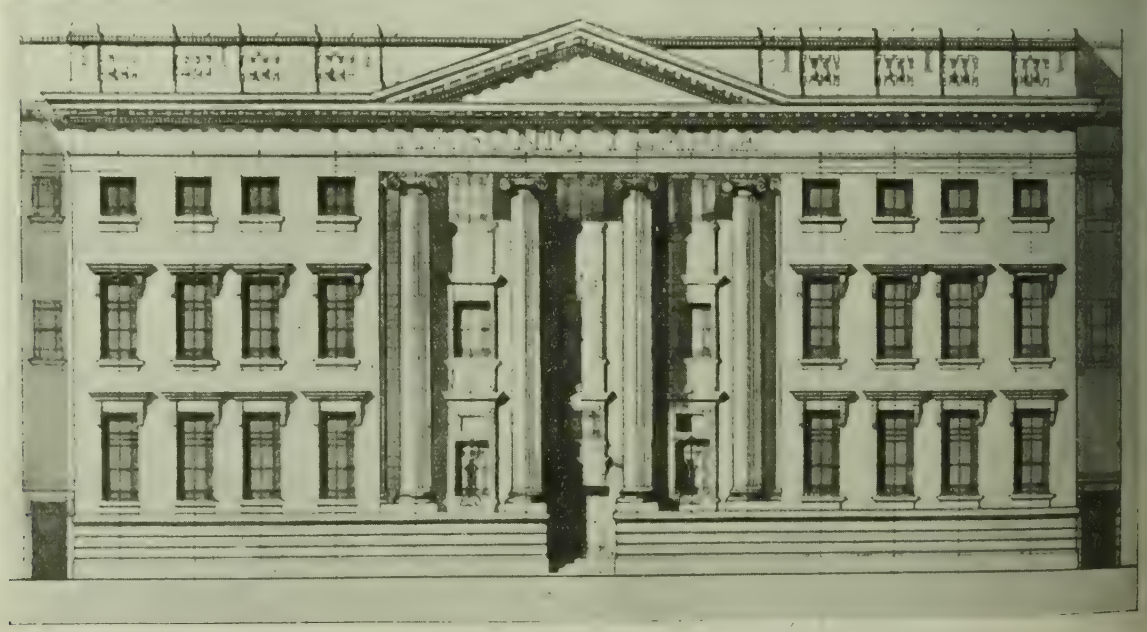
We trust we have shown that the argument that rent restriction must continue until the population can be housed, when pushed to its logical conclusion, is an absurdity. The only practical method of proceeding is to bring the diminishing protected class up to the same level, as quickly as may be reasonable, as the ever-increasing unprotected class. The Acts have now been prolonged until June 24, 1925, and we submit that period should not be further extended on any consideration. Already the protected tenants are practically claiming vested interests.

WAR MEMORIAL SCREEN, ST. MARY'S CHURCH, BARNARD CASTLE.

The screen illustrated on p. 534 is constructed of oak, lightly fumed, and is in the Decorated style of Gothic architecture to harmonise with its surroundings. It is fixed between the baptistry and the nave of the church, screening the congregation from the present outer doors at the west end.

It is constructed in four bays, each bay being mullioned with rich tracery in the heads, with solid oak panelling to dado height and leaded glass above, and finished with canopied cornice with carved cresting and deeply-recessed carving on the principal members. The centre of the canopy has a carved panel with inscription. Side wings of plain panel work and attached to the face of the piers to the existing archway have the names of those who fell inscribed thereon. The four panels in stained glass have embodied in their design a laurel wreath of Victory, a round sword, and a shield of St. George with Sunrise, symbolising the dawn of a new day; the other panels have a crown of glory surrounded by a circle representing unity, also a shield of St. Andrew and Shamrock with Cross of Suffering.

The screen itself has been constructed Messrs. S. Elliott & Sons, Ltd., of Reading, glass panels by Messrs. G. J. Baguley & So Newcastle, and the lettering by Mr. J. Dent of Gateshead, from the designs and under supervision of the architect, Mr. Richard Wy A.R.I.B.A., of Newcastle.



ANCIENT ARCHITECTURE.

On Wednesday, Sir Banister Fletch F.R.I.B.A., gave the first of twenty-four wee University Extension Lectures on "Anci Architecture," to be delivered at 6 p.m. ev Wednesday at the Central School of Arts a Crafts, Southampton-row.

During the session the lecturer will trace evolution of architecture in ancient Egy Babylonia, Assyria, Persia, Greece, Rome a Byzantium, with special emphasis on the fluence of ancient art on all subsequent sty down to its adaptation to modern needs in own day. In his first address the lectu pointed out that architecture was in all ages visible exponent of civilisation, and that study of architecture was necessary not o for architects, craftsmen and students, b also for authors, journalists, photographe and antiquaries, and the interest of hist was increased by a knowledge of the dw lings and temples erected by different nati for their social, religious and politi requirements, while for the general pub the ability to appreciate the monume of the past added to the enjoyment of travel a the understanding of our own surroundin The lectures will be illustrated by some twe hundred lantern slides, as well as by photograp and models.

Sir Banister gave an illustrated sketch ancient architecture, referring first to t different influences—geographical, geologic religious, climatic, social and historical—whi aided in the evolution of the building a Starting from the world-famous Sphinx—senti of the mysterious past—he reviewed by wo and picture the massive temples, and pyrami and other tombs of the Egyptians, the pala of the Assyrians and Persians, the temples a theatres of the Greeks, and the monumen buildings of the Romans, such as the Baths Caracalla, the stupendous Colosseum, t triumphal arches and the dwellings at Pomp as well as the churches of the early Christians a the peculiar work of the Byzantines.

The next lecture, on October 10, will be t first of three lectures on Egyptian architect

BOOK REVIEWS.

lish Interiors in Smaller Houses: From the Restoration to the Regency, 1660–1830. By M. Jourdain. (London: B. T. Batsford, Ltd.) 1923. Price 24s.

erfection of style commands attention even n, to certain individuals, its effects are llent rather than attractive. In the eyes of Gothic Revivalists and of that great critic rchitecture, John Ruskin, work such as is ribed in Miss Jourdain's book, "English riors in Smaller Houses from the Restoration ne Regency," seemed "wholly valueless and icable." They could not, however, ignore ppeal, and by their over-violent denuncia- may even have brought it before the public have hastened its return to fashion. If the strous attempt to revive Gothic style in ern times had no other good result, it at demonstrated beyond question that sham iæval architecture is altogether unsuited to requirements of the present day.

ne architecture of the later Renaissance is ittedly somewhat deficient in its recognition ructural interest, but in several important iculars it deserves careful study, more cially as it is exemplified in the smaller es built between 1660 and 1830. In these dings architecture came to recognise once e, after the fret and fuss of late Gothic ressing and pseudo-constructional rib-work oduced as ornament, the fundamental fact buildings should be made with walls whose surfaces need not necessarily be subdivided the semblance of a wire birdcage. Lines of lding and ornament were still applied, but directed towards the emphasis of shapes surfaces, of breadth and expansiveness as as height, instead of striking only an tent note of verticality. The rediscovery of value of breadth and space was perhaps the st result of classical study and in this field brothers Adam deserve credit for their onal investigations at Spalatro and their dance of the Palladian error of applying rs and pilasters as if classic architecture isted of nothing else. Even in the hands of adian architects the smaller houses escaped e of the excessive pilasters simply because s were not available for them and the many tiful chambers illustrated in Miss Jourdain's are quite as much examples of convenience f architectural style. They were, in the rity of cases, designed to be furnished and in, and the elements of their composition passed into the general custom of house truction.

n English builder includes a plastered ceiling plastered walls with a certain minimum of ldings almost as a matter of course, and it is by a purposeful effort that the tradition can hrown aside. What is now lacking is the combination of common sense and artistic etion which illuminates the old work. A disposition of the masses of light and shade d to make many a simple interior charm- The orderly placing of windows, preferably e broad side of a room, and the disposition of ooms in the plan to permit of this, made he utmost cheerfulness of effect.

is was a well-understood principle which t be studied again with advantage now that d, century-old, tradition of narrow-fronted and suburban houses has taught us fami- y with the wrong way of lighting rooms gh their ends. A glance over the illus- ons will show the reader what pains the rchitects took to avoid, or at the worst to ise, this unpleasant and dismal effect of ng. Where circumstances dictated that g room had to be provided with windows at one end, the other end wall was some- given a rounded form to increase light by tion from the curving surface as at 20, Cavendish-street (Fig. 66). Another ex- nt was to introduce columns and an lature to reduce the excessive length of oom and contrast the darkness of its end te from the windows with the light picked n the rounded shafts, as at the Ante-room. ood, by Robert Adam (Fig. 64).

Colour effects were generally managed cleverly in these interiors whether by the introduction of materials of different hue or by the employment of pigment. The use of wainscot at the beginning of the period under examination involved the placing of panels and styles in such positions as would admit of sound construction, and the instinct for bordering a mass of one colour with a suitable band of another colour was seldom completely lost. A great deal of freedom was permitted and exact symmetry not always sought, but the tradition in favour of allowing space for the two adjoining styles at the corners of rooms persisted after the substitution of stucco or wall-paper for the panelling, and generally prevented doors or other features being crowded awkwardly into the angle. Materials of different colour were arranged to admit of pleasing masses being composed with reference to the pattern likely to be produced by the interpenetration of one tone or colour upon another. That this effect was far from being the result of mere good luck is clearly shown by the original drawings by George Richardson, reproduced in Figs. 51 and 52, where the effect of the colour masses is rendered with the greatest care.

Walls, ceilings, windows and doors are illustrated in detail, and the evolution of the staircase from the heavy baluster type executed in oak in proportions almost suitable for stone to the dainty spiral "open well" is set forth in a series of excellent photographs. Of this kind of stair, with hanging stone steps corbelled out from the walls and provided with delicate wrought or cast-metal supports for the wreathed mahogany handrail, Miss Jourdain writes: "The clean lines of the spiral curve, the exposure of constructional feature, the economy of space effected, are all in its favour."

The book is well produced in every respect, and should prove of great practical value.

English Furniture: Its Essentials and Characteristics. By J. C. Rogers, A.R.I.B.A. (London: 20, Tavistock-street, W.C.2.) 21s. net.

This volume has an interesting foreword by H. Avery Tipping, M.A., F.S.A., who undoubtedly writes from much experience and study. The volume deals with the period of oak, walnut and mahogany, in addition to useful information on lacquer furniture. Each section is dealt with ably, and the historical notes add considerably to the interest. Many fine pieces are illustrated, some well known and typical, others, uncommon or unusual, of examples of the different periods, some from our National collections, others, examples from private collections accessible only to the favoured few. Three half-tone illustrations are supplemented by clear working drawings, as dear to the amateur as to the professional, by Mr. Rogers, showing the old methods of construction, examples of cornice profiles, arrangements of folding frames, gates and brackets on eighteenth-century tables, and other details too numerous to mention. It is here that the book shows an advance on the usual handbook. There comes a time when the collector, after his early stages, desires fuller information in a handy form; this the author has given him.

Cricket Pavilion, Uppingham.

This building, recently erected to the design of Mr. Michael Tapper, of 10, Melina-place, London, N.W., consists of two dressing-rooms with suitable sanitary accommodation and fittings, servery, scoring box and a main hall, 40 ft. by 20 ft., the walls of which are being lined with English oak panelling inscribed with the names of the cricket elevens for many years past. The feature of this hall is a refectory table, 26 ft. long, made of English oak, the top being in one length, with forms to match. The whole of the internal and external doors and half-timbering, verandah, balcony, and seats are also constructed of English oak with Weldon stone dressings to windows and steel casements. The roof is covered with Norfolk reed thatch. Messrs. J. Jarvis & Sons, Ltd., 8, Wormwood-street, London, E.C., carried out the whole of the works and joinery. The steel casements and glazing were supplied by Messrs. R. E. Pearse & Co. Messrs. William Oliver & Sons, Ltd., supplied all the oak. Messrs. Gillett & Johnson, Croydon, renovated the clock and supplied a new face.

The volume is an encyclopædia of information, and sound information, too. As an example, anyone becoming possessed of a mutilated piece could, from the details given, faithfully and sympathetically restore it to its original state.

The Stones of London. By J. Vincent Elsden, D.Sc., F.G.S., and J. Allen Howe, O.B.E., B.Sc., F.G.S., &c. A descriptive guide to the principal stones used in London, with a brief non-technical account of their characteristic features. (London: 30 and 31, Furnival-street.) Price 6s. net.

This book deals literally with the varieties of stone to be found in London, and covers a wide field, from the Egyptian Hornblendic granite of Cleopatra's Needle to the purple slates of Wales. The authors warn us against what they describe as "prejudice," pointing out that certain stones, such as Caen, Bath and York, have acquired definite associations, and that it is too often forgotten that stone from the same bed in adjacent quarries may vary widely in properties. The behaviour of a stone in a particular instance must not be taken as necessarily applying universally. Lists of buildings are included showing where the different stones can be seen, and the material is illustrated, in magnified photographs to demonstrate the structure, at the quarry, and in the completed building. The volume is well indexed, and includes descriptions of marbles from all parts of the world, artificial stones, and terra-cotta, faience, pavements, and roofing materials.

There are few errors more difficult and expensive to rectify than the wrong choice of a building stone, and the subject of selection is not one that lends itself to rule of thumb methods. This book should therefore fill a distinct place in disseminating a general knowledge of the properties and durability of different kinds of stone, and is one to which reference may be made with confidence.

History of Textile Fabrics. By Richard Glazier. (London: B. T. Batsford.) Price 21s. net.

The purpose of this manual is to give a history of figured weaving, tracing its development through what is termed the characteristics or styles of certain periods, communities or countries, and thus enabling those readers who are interested in woven or printed patterned fabrics to understand readily and appreciate the magnificent inheritance of beautiful and useful examples of the weaver's craft that now lie available to those who desire to know what has been done in the past and what may be accomplished in the future. Mr. Glazier deals with the technical basis of the art, and gives illustrations of various historic types of looms; materials used by the weavers are referred to, and the practical conditions and technical considerations in the printing of fabrics are explained. The history of weaving and printing is indicated, and the author also deals with such special work as damasks, Javanese Batiks, Japanese stencil cutting, church vestments, &c. The survey of the book commences with the earliest known woven fabrics, and carries the story to the commencement of the nineteenth century; after illustrating grave textiles from Egypt, and Peruvian weaving, it traces the evolution of pattern design through the Sassanian and Byzantine periods, touching on Indian, Chinese and Japanese textiles, and the productions of Islamic art in Persian, Turkish and Hispano-Mooresque weavings. After dealing with the styles of mediæval Italy, and other countries, the author sets forth the characteristic patterns of later design in France, Italy, Spain, Germany, Flanders and England. The illustrations consist of over 100 plates, in addition to a large number of diagrams, patterns and sketches in the text.

Lunch-time Rambles in Old London. (London: The Homeland Association, Ltd.) Price 6d. each net.

In these hurrying days, when few Londoners know their London well, and little time can be spared for the reading of larger volumes, these little lunch-time ramble books, suitable for carrying in the pocket, will be helpful to all who are interested in the historic streets and buildings in which the city abounds. Each book contains a street plan and a number of useful illustrations. Number 1 (by W. H. Fairbairns) takes the rambler Around Fleet-street; No. 2, Lambeth (Prescott Row); No. 3, Smithfield (H. M. Buckingham); No. 4, From Clement Danes to Lincoln's Inn (Elmand Emneth); No. 5, The Adelphi (W. G. Morris); and No. 6, By London's City Walls (W. E. Gawthorp). Other volumes are in course of preparation.

Sir Christopher Wren, 1632-1723. (London: 27, Tothill-street.) Price 7s. 6d. net.

This small folio on Sir Christopher Wren is a welcome addition to Wren literature, for it contains material which does not appear elsewhere, both in illustrations and letterpress, and is well produced. The authors of the eight articles cover fairly completely the various interesting and admirable aspects of Wren's genius.

Historical Notes on Lincoln's Inn Fields. By A. H. Marks, B.A. (London: Technical Records, Ltd.)

Mr. Marks' admiration for Lincoln's Inn seems almost to have blinded his judgment as to the merits of the other London squares. Few architects—indeed, few people of discernment—will endorse the statement that "the character of the buildings surrounding the square (Lincoln's Inn) is in pleasant contrast to the hideous boarding houses of Bloomsbury, and other squares in the neighbourhood." A comparison there certainly is, but few would call the squares of Bloomsbury, which contain some of the choicest examples of London eighteenth-century architecture, the work of Adam, Ware, Leverton, and others, hideous. The fact that they may be boarding houses is an utterly irrelevant consideration.

However, when Mr. Marks deals with facts, rather than opinions, his little book is full of interest. Indeed, Lincoln's Inn square is characterised by interest rather than beauty; its buildings form a heterogeneous collection far less complete in itself than many a Bloomsbury square of boarding houses, although some of the houses, such as Nos. 57 to 60—the latter two comprising Lindsey House—presumed to be the work of Inigo Jones—and the former two being unified by Sir John Soane's semi-circular porch, are of great beauty.

Lincoln's Inn, of course, is redolent of historical interest, and intimately connected with monastic organisations, notably the Black Friars, who subsequently moved to that part of the city now bearing their name. The dedication of the district to the legal profession dates from the Earl of Lincoln, who bought the property in 1286 for 550 marks, and, being a patron of lawyers, installed law students in his inn. Many are the vicissitudes through which the open spaces have passed, and Charles I's financial embarrassments were such as to lead him to sacrifice Purse and Cup Fields for building purposes; and all through the centuries, the ground has been threatened.

In 1842 it was proposed that the Royal Courts of Justice should occupy the site. However, in 1894, the Fields passed to the L.C.C., and the square was thrown open to the public.

On the Margin. By Aldous Huxley. (London: Chatto & Windus.) Pp. 229. 6s. net.

Mr. Huxley has collected twenty-seven of his short papers which were originally published in various weekly reviews. The dual rôle of critic and essayist is much more difficult to maintain than many people imagine, yet Mr. Huxley has given us some excellent examples of both. In his work there is much of that "sharp illuminating wit" which, he says, is a characteristic of Mr. Strachey, and if he appreciates excellence in whatever form it takes, he is merciless in his mockery towards shams. He seems to find the state of the world depressing, though he is obviously fond of life itself. He tells us that in this dim land of ours we are accustomed to pay too much respect to fictitious values, that we think too much of the past and too little of moment, as contrasted with the realism of Italians in their love of life for its own sa On the other hand, he has a horror of what terms organised activities or organised distr tions "which demand from pleasure-seekers personal participation and no intellectual ef of any sort." In the essay on Accumulati he suggests a world overwhelmed by an accu lation of antique objects which will end burying us "unless we set about methodic to get rid of the nuisance." The essay upon Christopher Wren (which is one of the best in book) is based upon a quotation from Rus Mr. Huxley considers that the architect qualities which most obviously disting Wren's work are precisely those which Ru so contemptuously disparages, and he expl the contradiction thus: "In all matters nected with art Ruskin is to be interpreted a interpret dreams—that is to say, as signif precisely the opposite of what he says." Huxley considers that everything Wren did the work of a gentleman, and he sees in his " a faultless proportion, a felicitous massing contrasting of forms." He points out that man who built the City churches was a prac genius of no common order, and that "no a tect has known how to make so much of a cult site and cheap materials." We ar sympathy with his comments upon the naus affectation at the end of the century which us the big houses "built with all the irregula and more than the 'quaintness' of cottag It is encouraging to hear him say that "t are signs that architecture is coming back to sane and dignified tradition of which Wren the great exponent," and that "architects building houses for gentlemen to live Clearly, he blames architects for having gotten, in their architecture, the art of gentlemen, but we would suggest as a sul for Mr. Huxley that he should investigate much of the client is to be seen in the desig his house, how far architecture should indicative of the people, and whether mistaking the gentleman. We recommend essays and criticisms; and those who lik touch life at all points, and who believe tha realities of life are based upon our little w nesses and fallacies, will find Mr. Huxley entertaining.

NCRETE CHURCH AT ASHFORD.

s church has been built for the Convent Good Shepherd, Ashford, Middlesex, on te of a wood-and-iron church, completely yed by fire last year. The building has rected with rock-face concrete blocks with al piers at roof truss centres. The plinth iers were built with plain concrete blocks red with cement and finished with a mixture shed sand, stone dust and cement, so rtioned to give an imitation of stone which reduces the monotony of the rock-walls.

church is roughly cruciform in plan, the chapel being 30 ft. wide by 100 ft. long k of altar. Beyond, forming the head of oss, is the sacristy, 30 ft. by 10 ft., with r above for storage purposes. Water is n to the sacristy. On the right of the altar nuns' choir, 30 ft. by 35 ft. long; and on ft of the altar a small secular chapel, d off with a screen having vertical louvres give a full view of the altar and obstruct iew of the nuns, who are members of an ed order. The main chapel is also divided lly and longitudinally by a solid screen in. high throughout the whole length of apel up to the altar rails. The whole of inery for doors, windows, screens, and ails, is of Oregon pine timber.

roof construction is quite different from was originally intended for the church. first place, "scissor beam" roof trusses ntended. After the walls were well under it was required to build a roof which be more in keeping with the general , and also to get much more height to the n as the wall-plate was only 14 ft. high. resented an interesting problem, in that ers already built were not designed to take rust from roof trusses, and, moreover, r for the first roof had already been d.

ammer-beam roof was decided upon and esigned to give vertical reactions without upon the walls.

r the sanctuary (*i.e.*, the intersection of ms of the cross in plan), are two trusses g diagonally from corner to corner and cting each other at the centre king post. ad in this king post was so great as to 2 in. diameter steel rod, which is boxed has a 10 in. by 10 in. oak block at the here the four rafters are framed in. At the n is an 8 in. by 8 in. oak block for the oping braces. The curved wooden braces nforced top and bottom with steel plates bolted together, and to reduce the eccentricity of the loads in this member steel rods were inserted on a radius line running through to the point where the collar beam meets the rafter. These diagonal trusses are 41 ft. clear span, and form a striking feature of the interior to those interested in structural matters. Mr. J. Weston, M.Inst.Struct.E., was consulted regarding this new construction and supervised the erection.

Concrete Church at Ashford, Middlesex: Exterior.

The trusses in the main chapel are 11 ft. 6 in. on centre with 6 in. by 2½ in. purlins, spaced 2 ft. 9 in. on centres. The roof covering is 1¼ in. tongued and grooved boarding, "V" jointed, felting and grey asbestos tiling. Five-pound lead valleys and flashings and soakers against gable walls were used. Grey concrete ridge tiles were used on the asbestos tiling.

Outside the church a plant house was built, comprising boiler-house, engine and battery rooms.

The heating arrangements, which were installed by Messrs. Ewart's, consist of "Ideal" radiators driven by an "Ideal" sectional boiler, which has to drive the water across the church roof above the curved braces of the roof trusses down to the radiators. The heating space is approximately 100,000 cub. ft. The electric light is obtained by a 2 K.W. petrol electric plant supplied by Messrs. A. Lyons, of Victoria-street. There are thirty-six points in and around the church.

The whole of the building work was carried out by Messrs. R. Murray & Sons, of Shepherd's Bush.

Concrete Church at Ashford, Middlesex: Interior.

MEMOIRS OF THE GEOLOGICAL SURVEY.*

THE GEOLOGY OF THE LONDON DISTRICT.

This pamphlet is a history of the London district, as revealed by a study of surface formations, outcrops, and the strata brought to light by borings. Covering, as it does, an immensely extended period of time, it takes us through epochs when London's foundations were laid under the sea, through sub-tropical and glacial periods, and eventually lands us into the comparatively genial period in which (but for the smoke) we live. London clay is the best-known of the strata underlying the area, a medium through which most of the tubes run, and admirably suited for boring purposes. In this clay remains have been found of crustaceans, fish, crocodiles, birds, mammals, and such plants as magnolias and the Ginkgo tree, and it is strange that, after so vast a lapse of time, the two latter should once more be flourishing in Hyde Park, having been re-introduced into London by man's agency. The thickness of clay under central London is not so great as might be expected, it having undergone a process of erosion. The boring at Meux's Brewery in Tottenham Court-road showed a depth of only 63 ft.; at Pall Mall, 120 ft.; and in the City from 85 to 130 ft. The fossils found in the higher beds of London clay indicate a climate somewhat similar to that now prevailing at the mouth of the Ganges.

Turning to modern times, we find an interesting account of London's smaller rivers. The West Bourne, which crossed the site of the Great Western Railway line near Royal Oak, was dammed in 1730 to form the Serpentine, a lake now supplied from a well sunk at its northern end in 1861. The West Bourne itself supplied the Bayswater district with water till 1844, but now runs into the sewers, the storm-relief sewer being visible where it crosses over the underground railway at Sloane-square Station. The Ty Bourne passed through part of the Regent's Park lake area, and through the Green Park. The Fleet River, or "Holebourne," starting at Hampstead and from Ken (Caen) Wood, ran down Farringdon-street, and was shown as an open river on Wren's rejected plan for the new London. The Wall Brook, flowing past the sites of the Bank and Mansion House, is the last of the principal "buried rivers" in London north of the Thames.

Enough has been said to indicate that these memoirs are of interest not only to the student of geology but to the architect, the engineer, and to any citizen who is interested in the development and history of London.

* "Memoirs of the Geological Survey: The Geology of the London District." By Horace B. Woodward, F.R.S. Second edition by C. E. N. Bromhead, B.A.; with notes on the palæontology by C. P. Chatwin. (Southampton: Ordnance Survey Office. Price 1s. 6d. net.).

THE BUILDING TRADE.

THE INCIDENCE OF INSURANCE.—I.

By A SPECIAL CORRESPONDENT.

"Renewal notices" for fire insurances are at the moment being issued broadcast, and between now and Christmas a far larger number of these yearly reminders will be posted before the 1923 policies expire. No comment upon such usual autumnal business would be needed but for the palpable fact that so many properties still remain insufficiently covered by insurance. This more particularly is the case with the lesser kinds of business premises, farm buildings, and houses generally, also ecclesiastical property and churches, some of which are of much architectural and antiquarian importance, far exceeding mere money value. Before the war, owing to the rise in prices, the Houses of Laymen and Convocation appointed a joint Committee of Inquiry into this matter, and in 1913 unanimously adopted its report recommending the formation of endowment funds towards obtaining more adequate parochial insurances. The Council of the Royal Institute of British Architects supported the project, urging its importance by issuing a special pamphlet and posting copies to all the diocesan and parish authorities in the United Kingdom.

Very little, it is to be feared, has since been accomplished, mainly owing to the straightened circumstances of all religious organisations throughout the land. The depressed state of agriculture, and the diminished incomes of middle-class owners of property; the difficulty of coping with the maintenance of business and of the family, besides meeting the demands of local rating and Imperial taxation—has doubtless induced many to run the risk of loss by fire, disregarding the importance of the average clause on which all such policies are based. Others, perhaps reckoning themselves immune by the consoling assurance that the actual risk of fire is very remote and negligible, or in other words tantamount to a bet made by the insurance companies with their policy-holder of one shilling and sixpence against a liability of £100. It is only when a fire occurs that the futility of such an argument is bitterly understood.

Meanwhile the increasing cost of building materials and labour, not to mention the interference with business by organised strikes, first in one direction and then in another, have combined to bring about serious liabilities inseparable from insufficient insurances. The great companies engaged in insurance business have repeatedly warned their policy-holders and by facts and figures demonstrated the actual state of affairs. These powerful combines are well able, of course, to look after their own interests without any special pleading on their behalf, and it need scarcely be said that what is here written is intended to prevent, if possible, further disasters taking place owing to the lack of forethought on the part of the insurer who for various reasons fails to protect himself in a reasonably proportionate manner against fire. During the present year several bad cases of this kind have happened, including an important and beautiful church which, if report can be relied on, was practically a total loss without any corresponding insurance provision for reinstatement of either the building or its valuable contents.

An example may be mentioned illustrating how risks inadvertently arise. The case is one with which the writer was professionally engaged not very long ago, situated in a most select residential square in London. Three houses, forming part of a row erected possibly by Thomas Leverton, were in course of remodelling by being newly refitted throughout in an up-to-date manner with new woodwork and stoves. Under professional supervision the work was being done by two first-class builders. No. A, adjoining Nos. B and C, belonged to a different owner from the others. The work at this first house had almost been completed when the fire broke out in No. B. The cause was due to a well fire having been installed in the ground floor front room of No. A. The party wall between the premises varied considerably in thickness. The architectural contrivance of the entrance hall in No. B had been managed by erecting piers of considerable projection, and the interspace in the vestibule, exactly behind the chimney breast of No. A, was filled in by a 9-in. wall. No measurements appear to have been taken, and the relative positions of the projections in No. B were not considered important as they certainly ought to have been. In order to obtain the required depth for the new well fire the fitter, regardless of consequences, cut away half the thickness of this 9-in. wall, a very risky thing, of course, to do in any event. No one appears to have known, or if they did know, to have remembered, that in most London residences of that period it was the traditional custom to build in wooden bricks to form fixing blocks for the joinery. The heat of well fires, as everyone knows, is considerable. In this case the half brick backing (more or less shattered by cutting away) was insufficient, hence the ignition of the nearest wood brick behind the skirting in No. B. The fire rapidly spread behind the boxing, and naturally the adjacent staircase in the inner hall was speedily in flames. Had this happened the day before, the whole place must have been burnt out because the hall then packed with the new joinery intended the principal rooms of No. B. The builde that house did not know what had been in No. A, so was free from blame. Fo nately the mishap took place in the day when the men were at work and gave alarm without delay.

The following incident differs entirely the one above described. A very large ing business in East Anglia was carried successfully for many years with isolated ber and thatched or timber and tiled maltings. A special rate of insurance been charged in consequence. The proprie were of undoubted repute, but the Insur Company at last refused to continue the at any price. Thereupon a big brick cement malting, constructed of concrete iron, exceptionally solid and strong, built. Shortly after completion this ca fire-resisting structure was ruined by The 18-in. walls were thrust out of upright, and the glazed brickwork throu out was considerably damaged. machinery became a wreck. The old tim maltings meanwhile remained unharmed, l ing still as fresh as paint after the fire. writer was consulted as to whether the spreading walls could be righted or not. were drawn up to the vertical and reinsta The heat from the malt having no means escape, as happened in the old woo shanties, set the brick-built malting on by spontaneous combustion. This case dem strates the uncertainty of fire risk and ju fies the common-sense advice not longer neglect a readjustment of fire insura premiums.

ESTIMATING FOR SMALL BUILDERS.—VII.

By J. H. BARNS, F.I.O.B.

SMITH AND FOUNDER.

One can readily imagine that constructional steelwork of a steel-framed building is something in the nature of a sealed book to the small builder, and it is hardly likely that he will be required to deal with such a structure, and if he were he could place himself in communication with one of the well-known constructional firms, who would be pleased to give all particulars, designs and estimates. No attempt will, therefore, be made to deal with this subject; but, as the small builder is often required to fix constructional steelwork in the form of steel joists, girders and stanchions, a little information on this subject may be useful.

The sizes, weights and strengths and a whole wealth of information concerning the required material will be found by consulting some of the section sheets and books issued by the various steel constructors, and these, with a little common sense, will enable the small builder to find out exactly what he requires. At any rate, he can err on the side of safety and no constructional expert can do more.

The first price given will be for plain steel joists in stock lengths. The basis price is charged for ordinary sections of steel joists, and some of the smaller and larger joists are charged at a higher rate. Joists are supplied in inch over or under the length stated without extra charge; or, to put the matter another way, if a 20 ft. stock length of steel joist were ordered it may measure anything between 19 ft. 11 in. and 20 ft. 1 in. If steel joists are cut to exact lengths, the cutting and waste would be charged for, or an all-round price would be charged for the steel joists cut to exact lengths. Steel stanchions which consist of the usual rolled steel joist section with a cap and base plate and the usual bracketed connections, are sold at a covering price for the completed article, say, £17 10s., although any extra labours or cleats for further attachments would be charged separately. If the stanchion is a compound one, which would mean a steel joist as shaft with plate on each side riveted on to afford greater strength, it would be charged for at a higher rate than the plain stanchion, say, £18 10s.

Compound girders being a compound of rolled steel joist with plates top and bottom, are charged for at an inclusive rate, approximately £15 10s. per ton for the beam, the extra angles and attachments being charged in addition. The price per hole is charged for each thickness of metal, so that, if a ¾ in. hole were drilled through four thicknesses of metal, the price would be equal to four holes in a single thickness. If steel joists have to be fixed and attached to the side of another joist, the connection would be charged separately. Rolled steel joists to British standard sections, loaded in vans at merchant's yard, for sections from 3 in. by 3 in. to 16 in. by 6 in., the basis price to-day is about £12 per ton. Except that 9 in. by 7 in. section costs 5s. per ton over basis price, and the 10 in. by 8 in. section 10s. per ton over basis price,

6″ ×1½″ 7″ ×3″ 7″ ×1¾″	Over basis price. sections would be.... 20/– per ton
6″×1¾″ 7″ ×3″	..... 10/– per ton
7″ ×7″ 7″ ×7½″	..... 10/– per ton
7″ ×7½″	..... 20/– per ton

The approximate price charged for cutting to exact lengths is about 10s. per ton, but, should only a single joist be required to be cut to a odd length the stock length would be charged, and the builder would have to pay in addition for the cutting, probably 1s. or 2s., and the portion wasted.

The price of rolled steel channels is about 10s. per ton, on the basis price for joists.

Steel tees would cost about .. (On basis price for joists)	25/– per ton
Angle cleats riveted on to joists	24/– per cwt.
Single notches to 5″×3″ steel joists	1/– each.
Single notches to 6″×3″ steel joists	1/– „
Single notches to 8″×4″ steel joists	1/6 „
Single notches to 10″×5″ steel joists	1/9 „

Double notches twice the price of single notches. Joggles cost about one and-a-half times the price of the notch. The cost of delivery of steel joists will depend upon the district, probably 10s. to 20s. per ton. Unloading, hoisting, and fixing steelwork, including for use of tackle, would cost from £2 10s. to £4 per ton, exclusive of any bricklayers' work. Holes drilled in web or flanges at works, 3d. each. Holes drilled in position on site about 1s. 6d. each.

The prices quoted are for steelwork in London stock. Cheaper rates can be obtained if the material is bought direct from the works and in fairly large quantities, but this may necessitate waiting for some time until the particular sections required are rolled. This information can be obtained from the "rolling programme" of the mills, which is issued periodically. The safer plan for the small builder is to buy his steelwork from London stock. The ordinary builder's smith's work, including roof straps, bolts, ties, &c., can be bought for about 36s. per cwt., and the fixing will be worth about 7s. 6d. per cwt. Wrot iron balustrades to staircase would cost 48s. per cwt. fixed complete, including running in ends of balusters with lead

Example :—

1 ft. run wrot iron balustrade with 2 / ¾ in. by ¾ in. square bars to each step, the ends to be run in lead to stone steps, and 1½ in. half round rail at top screwed or riveted through

	s.	d.
1 ft. run 1½″ H.R. rail (14 lbs. at) 2 / 3 ft. ¾ in. ×¾ in. balusters (48/– cwt.)	6	0
Add profit and oncosts, 15 per cent. ..		11
	6	11

The mortices in steps to receive balusters would be charged for in addition, probably 2d. to 4d. each.

STEEL REINFORCEMENT FOR CONCRETE.

The rods are usually kept in London stock in about 16 to 18 ft. lengths; longer lengths can be obtained from works without extra cost.

¼″ Round mild steel joists ..	15/6 per cwt.
⅜″ „ „ „ „ ..	14/9 „ „
½″ „ „ „ „ ..	13/– „ „
⅝″ „ „ „ „ ..	12/6 „ „
¾″ „ „ „ „ ..	12/6 „ „
1″ „ „ „ „ ..	12/6 „ „

If obtained direct from works would cost about 20s. per ton less. The cost of bending the rods as may be required for reinforcement of floor slabs, beams, or stanchions, will depend in a measure upon the number of rods required to be bent or cranked to each pattern. Each bend would need to be drawn out full size for the guidance of the bender, and if a large quantity is required to one drawing it would reduce cost of setting out. This would apply more particularly to the reinforcement to beams. Some of the rods used in reinforced concrete work for beams and stanchions will need little or no bending. The small rods or stirrups required for tying the main rods together will need to be wired at required position with fine annealed wire. The cost of labour bending steel for reinforcement for slab floor would cost about 6s. per cwt. Ditto bending and cranking rods for beams and columns and lacing together with stirrups and placing in position in wood casing to receive concrete, 8s. to 12s. per cwt.

Example :—

Cwts.

— Wt. mild steel rod reinforcement for slab.

1 cwt. steel rods, say	£0	15	0
Labour as above		6	0
	£1	1	0
Add 5 per cent. for waste and use of tools		1	0
	£1	2	0
Add profit and oncosts, 15 per cent.		3	3
Per cwt.	£1	5	3

RAINWATER PIPES.

Cast iron rainwater pipes, either round or square, are usually sold in 6 ft. lengths at list of prices fixed by the trade association. Shorter lengths are sold at higher prices, the difference apparently being due to the shorter lengths which include the same socket, weighing more per ft. than the longer lengths. The diameter of a rainwater pipe is measured from inside to outside. Rainwater pipes are sometimes specified to be a certain size "internal diameter" which necessitates the pipe being fractionally larger than the ordinary sizes, and, as there is no great demand for them, the prices are considerably higher than for the ordinary pipes. No difference is made if the pipes have or have not ears cast on. The merchants will supply the pipes painted with one coat of paint for about 5 per cent. extra on cost of pipes. This saves labour on the job, as it prevents them from becoming rusty, thus keeping the pipes in a better condition ready for painters. Painting to rainwater pipes is usually done on the outside only. They can be had painted on the inside at a small increased cost.

There are many methods of fixing rainwater pipes. The ordinary method is to nail the pipe to the wall through the ears provided. Most other methods are attachments to keep the pipes away from the wall, and to allow room for painting behind the pipe. The cost of such fittings is usually small, according to the pattern selected, but as they need the positions to be carefully set out and holes cut by bricklayer, and something or other built into the wall the labour for fixing (say 1s. 6d. per clip for each socket) is usually an expensive part of the cost of the contrivance. The disadvantage of using some unusual fitting for fixing rainwater pipes is that, when repairs accrue, it may be difficult to replace the broken parts.

Example :—

Ft. run 3″ diameter C.I. rainwater pipes with ears cast on and fixing with galvanised nails to brickwork.

	s.	d.
6 ft. run 3″ dia. rainwater pipe	4	4
2 nails		1
Red lead putty for joints, say		2
Fixing, 8d. yd.	1	4
	5	11
Add for cutting, 10 per cent.		7
Cost of 6 ft. length	6	6
Cost of 1 ft. length	1	1
Add scaffolding, say ½d. per ft.		½
	1	1½
Add profit and oncosts		1½
	1	3

When an estimate is prepared it is not usually known where the joints will occur in the rainwater pipes, or the lengths in which they will be required. The 10 per cent. included for cutting is a provision either for the labour and waste consequent upon cutting, or the enhanced price of pipes is in short lengths. The item of 1d. per yard, included for scaffolding is a contribution towards the scaffolding, which is presumably already in position. If special ladders or scaffolding have to be provided and erected the cost must be added to the above.

Round Cast-Iron Rainwater Pipes.

	Per Yard				
Diameter	2″	2½″	3″	3½″	4″
6 ft. lengths ..	1/7½	1/10	2/2	2/6½	2/11
2, 3, or 4 ft. lengths	1/10	2/0½	2/4½	2/9	3/2
Fixing	7d.	7½d.	8d.	8½d.	9d.
	Each				
Shoes	1/1	1/2½	1/5	1/11	2/2
Offsets, 4½″ to 6″ projection	1/7	1/11	2/2	2/5	3/1
Single branches	1/10	2/2	2/8	3/1	3/8
Heads, flat or angle.	1/9	2/–	2/4	3/–	3/3

For a fair quantity slightly lower prices would be quoted. The labour fixing shoes can be taken as about equal to half-yard of pipe of similar diameter. Ditto: Fixing to offsets (commonly known as "swannecks") as one yard of pipe. Ditto: Fixing branches (junctions) as two yards of pipe.

GUTTERS.

Gutters may be roughly divided into two classes—the half-round and the moulded sections. There are about three kinds of half-round gutters, the ordinary half-round, the deep, and the deeper sections, and of three different thicknesses of metal, about $\frac{1}{16}$ in., $\frac{3}{16}$ in., and $\frac{1}{4}$ in. Of the moulded gutters there are the ordinary "O.G." section, which is classed according to the width only (say 5 in.), no depth being stated, and the moulded gutters, which have width and depth mentioned as 5 in. by 4 in., &c. Half-round gutters will require some kind of wrot-iron bracket, of which there are many patterns, for fixing gutter. It is safer to use a bracket with a clip at the back to prevent the gutter tilting over when a ladder is placed against it. The O.G. or moulded sections are usually screwed to a wood fascia. The screws may be the ordinary iron, brass, or copper ones; but they are not very satisfactory as the heads are small. The best method is to use (say) 1½ in. galvanised mushroom-headed screws, costing about ½d. each, which give a much better fixing.

Ordinary C.I. Half-Round Gutters.

	Per Yard			
Width	3″	4″	5″	6″
6 ft. length	1 2	1/4	1/8	2/4
Short lengths	1/3½	1/5½	1/10½	2/6½
Fixing	9d.	9d.	10d.	10d.
	Each			
Angles and nozzles ..	1/–	1/3	1/7	2/3
Stop ends	3½d.	4d.	7d.	8d.

Example:—

— ft. run 4″ C.I. H.R. gutter, including brackets and fixing.

	s.	d.
6′ run 4″ gutter	2	8
Gutter bolts and red lead..		2
2 gutter brackets, say 4d. each		8
Fixing, say	1	6
Cost of 6′ length	5	0
Cost of 1′ length		10
Add cutting, 10 per cent.		1
Add scaffolding, say ½d. per ft.		½
		11½
Add profit and oncosts, say 15 per cent.		1½
Per ft.	1	1

Cast-Iron O.G. Gutters.

	Per Yard			
Width.....	3″	4″	5″	6″
6 ft. lengths	1/6	1/8	2/1	2/8
Short lengths	1/8	1/9½	2/4	2/10½
Fixing	10d.	10d.	11d.	1/–
	Each			
Angles and nozzles..	1/5	1/6	1/8	2/5
Stop ends	3½d.	3½d.	6d.	6d.

Ordinary O.G. gutters have the backs slightly sloping. If supplied with straight back cost about 2d. yard additional.

Example:—

— ft. run 4″ C.I. O.G. gutter with socketed joints and fixing.

	s.	d.
6′ run 4″ O.G. gutter	3	4
Gutter bolts and red lead..		2
Screws		1
Fixing	1	8
Cost of 6′ length	5	3
Cost of 1′ length		10½
Add cutting, say 10 per cent.		1
Scaffolding, say		½
	1	0
Profit and oncosts, say 15 per cent. ..		1½
Per ft.	1	1½

C.I. Moulded Gutters, Ordinary Sections.

	Per Yard.		
	4″×3″ ..	5″×4″ ..	6″×4″
6 ft. lengths	4/– ..	4/6 ..	5/2

Cost of short lengths up to 2′—equal to 1 yard.
Above 2′ and up to 4′—equal to 1½ yards.
Above 4′ and up to 6′—equal to 2 yards.
Angles and nozzle outlets—equal to 1 yard.
Angle stop ends—equal to ⅓ yard.

Example:—

— ft. run 4 in. by 3 in. C.I. moulded gutter with socketed joints, and fixing to wood fascia.

	s.	d.
6 ft. run 4″ × 3″ gutter	8	0
Gutter bolts and red lead		2
Screws		1
Fixing	1	9
Cost of 6 ft. length..	10	0
Cost of 1 ft. length..	1	8
Add cutting, 10 per cent.		2
Scaffolding, say ½d. ft.		½
	1	10½
Add Profit and Oncosts, say 15 per cent.		3½
Per ft.	2	2

PAVEMENT LIGHTS.

There are two kinds of pavement lights, those finished with the glass dropped straight into the pockets in the iron frame so that the iron surface is seen at the top, &c., are described as pavement lights with iron surfaces, and those in which the ironwork is sunken and filled in to form a cement surface. The kind of glass will considerably affect the cost of the lights. There are large prisms with serrated edges to catch the light; there are the semi-prisms, the convex lens, and a glass which is prism and convex lens combined. The beaded, button, checkered, or convex lenses go into the next category, and the rough plate glass lights are the cheapest of all. To determine the question as to which is the most suitable pavement light, one must inspect the place to see if there is a beam going right at the back of the light, as it would be useless to put a prism to reflect the light if the light when deflected could not enter the premises. In this case it is usual to put a few rows of convex lens near the building, and those farther away in the same frame where they will get a larger amount of light to be glazed with the prisms.

The frames can either be glazed with prisms throughout, or prisms and another kind of glass, say, convex, alternately. There is no doubt that a very good light can be obtained by using the best prism pavement lights, but it has hitherto been a disadvantage that the large prisms have an unfortunate habit of breaking off or flaking at the top, probably due to some fault in annealing the glass. In many places in the City you will find wirework fixed under the pavement lights to catch the pieces of glass if they fall. Recently some of the makers have been putting on the market a pavement light glazed with a prism which they will guarantee for five years against flaking.

The approximate prices for pavement lights for ordinary sizes made to reasonable dimensions and delivered in London, are:—

	Per ft. sup.
Iron faced pavement lights with large prisms	13/–
Ditto, semi-prisms and convex	10/6
Ditto, small prisms	10/–
Ditto, small prisms and convex.. ..	9/6
Ditto, beaded, button, checkered and convex	9/–
Ditto, rough plate glass as lens	8/6
Pavement lights with cement surface and glazed with large prisms	19/6

And other prices in proportion.

The cost to fix pavement lights is about 1/– to 1/6 per ft. super. The common method is to fix them in a rebated stone curb, and fill in the joints with Portland cement. These invariably leak sooner or later, and the more satisfactory way is to bed them in some mastic cement, of which there are many kinds on the market (such as "farotex"), so as to allow for expansion, &c. Iron stallboard lights fitted with some kind of reflecting lens would cost about 10/6 per ft. super, and with a plain kind of lens about 10/– per ft. super, and fixing about 1/– per ft. super additional.

Glazed cellar flaps would need to be counterbalanced by means of springs, and should be fitted with a gutter on all four sides and a movable bearing bar provided for the back. Such flaps fitted with a small convex or similar kind of lens would cost about 21s. per ft. super. and fixing about 1/6 per ft. super additional. It is not advisable to fix large prisms in a cellar flap, as they are very apt to get broken.

Southampton Harbour Scheme.

A scheme of dredging, estimated to cost £38,000, is to be undertaken by the Southampton Harbour Board if an agreement made with the British representatives of the United States Shipping Board is ratified in Washington.

Another important Southampton scheme is that of reclaiming 200 acres of land on the Marchwood site of the River Test, opposite the site of Southampton's proposed new docks. The land would form a suitable site for several industrial enterprises, and the scheme would provide work for one thousand men for three years.

Wages on Public Works.

The Public Works Conciliation Board has fixed the following rates of pay to apply to the City and County of London within the Metropolitan Police area, for the three months ended December, 1923. For the City and County of London the labourers rate is 1s. 3½d. per hour; blacksmith, 1s. 8d.; concrete leveller, 1s. 3½d.; duct or earthenware drain layer, 1s. 4½d.; fitter, 1s. 8d.; granite mason kerb, &c., 1s. 9d.; granite sett dresser, 1s. 8d.; jointer, 1s. 4½d.; kerb fixer, 1s. 8d.; pavior, 1s. 8d.; petrol locomotive or roller driver, 1s. 5½d.; pipe jointer (iron up to 6 in.) earthenware or concrete pipes and conduits, 1s. 4½d. to 1s. 5½d.; pipe jointer (iron) above 6 in. diam, 1s. 5½d.; platelayer, 1s. 4½d. to 1s. 5½d.; platelayer's labourer, 1s. 3½d.; pneumatic pick operator, 1s. 4½d.; rammerman, 1s. 4½d.; scaffolder, 1s. 6½d.; screeder, 1s. 4½d.; steam roller driver, 1s. 7½d.; street mason and flag dresser, 1s. 7½d.; tarpot man, 1s. 3½d.; timberman, 1s. 4½d.; wood-block layer, 1s. 4½d.; men working in "boots," 1d. per hour extra; watchman, 7s. 6d. per shift minimum day or night. Hours of labour and overtime rates as agreed on March 11, 1920.

New Tube Stations.

Several Tube Stations in London are to be reconstructed. Piccadilly Circus Station is to be rebuilt on a plan devised to cope with the extraordinary growth in passenger traffic in recent years, and will be 15 ft. immediately beneath the Circus. The station will have seven entrances. Oxford Circus, the Bank, Westminster and other tube stations are also being reconstructed to cope with modern requirements.

E MASONS' DISPUTE: AND THE CAUSE.

By S STRANKS (*Organiser of A.U.B.T.W.*)

are glad to give Mr. Stranks the oppor- of stating his views in this article, we do not agree with all his observa- and we invite his consideration of our article this week. But we do most associate ourselves with the sugges- which he refers of a general conference irects builders, operatives, and others, he object of arriving at an under- g which will secure satisfactory and able and, it is to be hoped, a lasting n the industry.—ED.]

unconstitutional action of London in striking against certain London as attracted public attention, especially art directly interested in the building y. This dispute calls for special con- ion because the masons' action only d the widespread and deep-rooted un- prevalent among building operatives lly, but for the moment it is my in- to confine my observations to the n situation as affected by the dispute s settlement.

officials of the operatives' union are ware of the unrest existing, and I am he London employers appreciate the n: in fact, I am inclined to the view e significance of the masons' action has en overlooked by the members of the .A. In putting the reasons for the s' action before the National Joint Con- . I drew their attention to the fact n the building trades the masons had putation of being one of the best dis- d forces, and during my whole ex- e they had conformed to constitutional : hence their recent departure from this should stimulate serious thought as to plications.

reasons for the unrest among the Lon- eratives can be given under the follow- eads:—(1) Deep resentment at drastic ons in wages; (2) resentment at the tion award of Sir Hugh Fraser; (3) e of settlement of the working hours n; (4) the violation of overtime rules ployers; (5) the tendency of employers k the whole spirit and letter of agree- regarding mess-rooms on jobs.

st be excused for repeating that the g trade employers did by profuse pro- create a feeling of expectation in the ves' ranks of better things; the Wages nditions Council scheme was to stabilise ject better conditions; but on the first f the economic power of the worker g through slackness of trade, the em- Federation pressed their power for ons of wages again and again until f we take the respective earnings per of the journeyman and labourer in , we find the former earns £3 11s. 6d. labourer £2 14s. 1d. This is without ons for insurance, and these earnings the assumption that the operatives ll time throughout the year. Taking s, inclement weather, unemployment, er losses, it will be found that the net s per man are much below the figures Is there anyone prepared to say such allow a man and wife to do justice to mily? If so, all I can retort is let y it, and see what it means in practice. rer's position is especially bad; the working day after day sore at heart ages made in their standard of life. hen the reasons for these low wages that the bitterness of heart is shown stified.

building worker is asked to look at the low wages of other workers as com- th his; there is too much generalising regard. Some workers are receiving as much or more than building opera- nd certainly it cannot be said their occupation is of more valuable service. But let us assume the building trade worker is slightly better off—what an insult for this to be pressed! "Yes," it is said, "you are not receiving a wage sufficient to live, but look around and console yourself with the fact that others are more reduced in circumstances!"

One of the arguments for reduction in wages was the desirability of reducing the high costs of building operations. We agreed this problem had to be met. The worker is of opinion that his contribution in this connection is greater than that of any other interest engaged in the industry; further, he insists that cheaper production is not to be achieved at the expense of his and family's comfort. He looks around at the building he is working on, and while he is not opposed to seeing the best it is only natural when he is engaged daily, as he has been the last two or three years in London, assisting in the erection of costly and luxurious buildings, continually to ask whether there is not something wrong which condemns him to starvation wages on the erection of buildings of which the owners appear to have unlimited means. Certainly let us erect handsome buildings, but in doing so do not insult the worker by utilising his labour at starvation rates. It is no secret that some of the firms for whom these magnificent buildings are being erected have made enormous profits during the last few years.

There is a rather important phase in relation to costs of buildings to which I must refer at this juncture, viz., output. The main thing we have to bear in mind is that output varies according to the amount of trade. This has been stressed by me in previous articles, but I am of the opinion that builders in London could table some interesting figures on the relation of output to wages. If we dismiss the war period we find that soon after the introduction of the 44-hour working week a marked increase in output was gradually manifest, but since the reduction of wages there has been a reaction, and output has diminished. Is there any wonder? Do we expect the best service when a bitter feeling exists because the worker is conscious that justice is not done to him? I venture to assert there is not one general foreman who will not agree that, taking the sociology of the worker of the present day, the low wages complained of produce an atmosphere on jobs which conduces to anything but high output. The late John Ruskin's expression, "Cheap and nasty," can very well be applied to present conditions in the building industry.

On two occasions the operatives were balloted on the question of wages and hours, and in each case a big majority was cast against terms submitted. Their complaint is that the national representatives ignored these votes; more especially on the last occasion resentment was displayed, and now exists, but the feeling of resentment was coupled with a feeling of amazement when Sir Hugh Fraser gave his award. The view held is that the arbitrator had ignored one of the main terms of reference, *i.e.*, the question of the legality of the employers' action in pressing for another reduction without complying with the machinery of the Wages and Conditions Council scheme, in view of the evidence that legal and other well-informed authorities held that the employers' attitude was a breach of the document; and then, in addition, we find that although this point was not dealt with in the award reductions were imposed. Is it any wonder the operative was indignant at the whole proceedings?

The arbitrator also struck out of the award a clause of which the employers made free use when the operatives' power of resistance was weak in consequence of unemployment. I refer to the clause which gave either side the option to give notice for a reduction or increase of wages on the grounds of the state of trade or other circumstances. The workman points to the fact that while the employers had the full benefit of this provision he is denied such freedom now economic power is with the employers.

The question of the 44-hour working week has been a disturbing feature in the industry practically the whole time it has been in operation. The operative has been suspicious of the employers' attitude on this question. He formed the opinion that the only particle of concession accruing as a result of all the employers' profession of a shorter working week was to be taken from him! The attitude of the employers on this question has been a source of keen irritation, to say the least. It was held that the terms of settlement referred the 44-hour week or otherwise to each region to arrange; instead of this being conformed to we found when the Regional Councils met that employers took up a stonewall attitude, and the inference we drew was that there was a desire to keep it still in the negotiating arena in the hope of destroying the 44-hour week. The good will at the back of the original settlement was lacking. There was no intention on the part of builders to judge each region on its merits; but, on the other hand, every attempt was made to prejudice the progressive districts by putting up the reactionary regions against them. The operatives were resigned to the regional arrangements on hours; in the London region we are anxious for a settlement. It is a source of a great deal of unrest. The builders are absolutely standing in their own light by allowing the hours' question to be kept dangling over the heads of the operatives.

Regarding overtime, there have been flagrant abrogations of the working rule agreement. Here, again, is a prime cause of suspicion of the *bona fides* of employers. It is held, right or wrong, that the employers have done their best to depress the workers' wages; they are doing everything possible to encourage overtime, and thus be able to defeat the 44-hour week.

I have had about 38 years' experience of the building industry, and in the whole of that period I have never seen such bad conditions obtaining on jobs in respect of mess-rooms as during the last two or three years. The working rule agreement, again, has been ignored. It has been a wonder to me that in some cases the men have put up with the conditions for one moment. The conditions have become so bad, and the disregard of employers so glaring, that faith in them honouring this rule is gone. As a result the operatives' Federation Council has unanimously decided to promote a movement for statutory powers to compel attention to be given to one of the most elementary rights for each human being, *i.e.*, light, air, and cleanliness, for the purpose of spending the only relief from working hours for their meals. Talk about efficiency and output, but how in the name of common sense can any employer expect these things when he ignores the elementary rudiments of health?

In presenting a case such as the one in question, there is always the risk of misunderstanding by being too general and sweeping. In any statement made I want (and feel a pleasure in doing so) to state that there are builders in London who do not come under the strictures I have made; they do their best on hours, mess-rooms, and other matters to honour the spirit and letter of working agreement. Again, I believe there are firms in London who take a more enlightened view on wages than unfortunately has been seen in the wages controversy recently.

The masons have returned to work as a result of official efforts to find some avenue for them and other sections of their fellow-workers to present the grievances indicated, but do not let any interested in the industry imagine the action of the masons was the outcome of a few disgruntled persons. I think

through my daily contact with the men I am able to speak with some authority on the present position. It cannot be allowed to develop. The risks of a big dispute are great, and it is up to both sides to centre on the problems with the object of a peaceful solution being found. This, I feel, can be done by a frank attitude being adopted. With good will the difficult position now confronting the London region can be negotiated.

The national joint body, which composed the masons' difference for the time being, in the terms of settlement advised the L.M.B.A. and the operatives' side to take steps to call the Regional Council together and to receive representatives of the operatives to place their views regarding wages, hours, overtime, and conditions on jobs. This meeting will be held on October 8, and I sincerely trust that as a result at least one or two questions will be settled at once. Mess-rooms ought to be an easy matter to decide; the rule is in existence, but it is the duty of the L.M.B.A. to take immediate steps definitely to send representations to their members. The question of the number of working hours ought to be settled once for all. Overtime and wages present more difficulties; but they must be dealt with on broad lines, with due appreciation of facts. Regarding the grave tendency for insane time limits in contracts, and the nerve racking pressure which is inflicted on contractors to complete a building in an unreasonable period, this is a problem which must be faced by all interests concerned. I hope the suggestion thrown out for a general conference representative of architects, builders, operatives (and it appears to me also that foremen and clerks of works should take part) will be called at the earliest opportunity. Mutual confidence is essential, and this can only be achieved by an interchange of views so that some mutual agreement can be arrived at. On the part of the operatives' union, there is a definite stand being made against the overtime prevalent, most of which is illegal. It is claimed that rules and regulations are worthless if present conditions continue. On the other hand, builders must know that the mad rush for overtime is only demoralising the industry; good management has no chance under it, more especially as overtime of the character complained of is costly and produces inefficiency.

I cannot close without extending my thanks to the Editor of *The Builder* for giving space for the operatives' point of view. It shows a sense of fairness which is not always a feature in journalistic circles, but giving all sides a chance to ventilate opinion and grievances must produce good results.

Saturday Half-Holiday.

Mr. E. Walter writes:—

Sir,—With reference to your correspondent's question last week, I once saw a similar one in a Labour paper, but do not remember seeing an answer. So far as one can learn, the Saturday half-holiday originated with the Church. The word holiday is really "holy day." There were many holy days recognised by the Church, and in olden times there was strict prohibition of work on these days and Sundays. It was a custom to solemnise the eve of such days by religious services, so work was stopped on Saturday after the noon bell was rung. This Saturday half-day was lost at the Reformation, and only of late years has it been regained.

This may be of sufficient interest and help to your correspondent and others to seek further confirmation of a fact—that many who enjoy the Saturday half-holiday may not realise it has any connection with religion.

Kingswood School, Bath.

The Governors of Kingswood School, Bath, have accepted an offer from the Right Hon. T. R. Ferrens, of £15,000, to defray the cost of erecting new buildings, including laboratories, lecture-rooms, &c.

October 12.—**Truro.**—Architect's Assistant re- d by Cornwall C.C., in the Small Holdings Dept., orarily. The County Land Agent, County Hall,

RATES AND RATING *

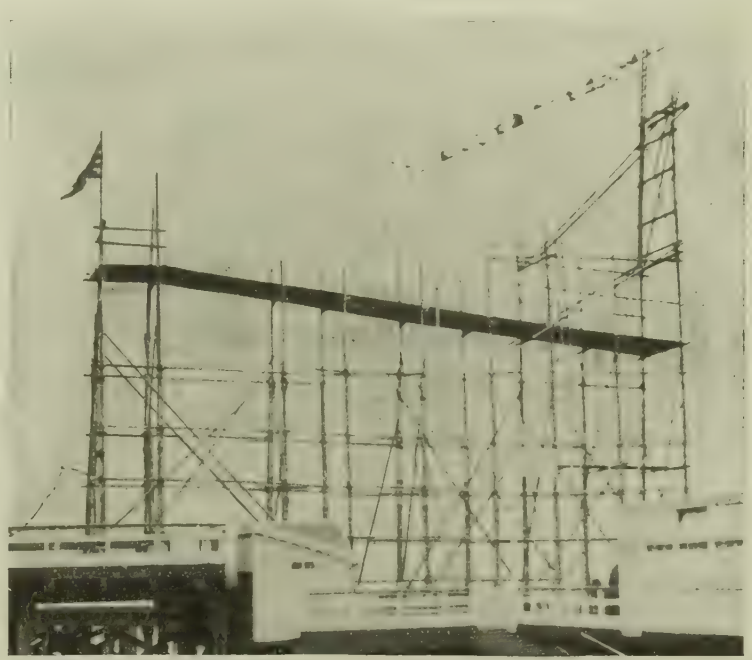
This appears to us an excellent little treatise, containing a clear exposition of the law and practice of rating in a comparatively small space. The actual text comprises 196 pages, but the appendices form an important part of the work, which, including the appendices, comprises 310 pages. The first appendix contains some practical notes for rate collectors and overseers, by Mr. Arthur Hunnings, who has been rating surveyor to the Metropolitan Borough of Hackney and a lecturer on rating for the County Council; and in the second appendix he has also contributed some notes on valuation. The third appendix contains some leading cases, and a fourth notes on inhabited house duty. The author in his preface acknowledges the assistance he has received from both Mr. Creswell and Mr. Hunnings, with their very special experience in the law and practice of rating, and, so far as we have examined this work, we find the subject treated with remarkable clearness and accuracy. We may specially note that one of the chapters is devoted to the "Blue Form" in connection with the new assessment under schedule A, and another chapter deals with inhabited house duty. Public attention will be called to the subject of rating and valuation in connection with the draft Bill, which has just been issued by the Government for the consideration of those authorities who are concerned with these questions, and the consideration of that Bill will necessitate an accurate knowledge of the existing law and practice, and it therefore appears to us that this little volume, offered at a most moderate price, has appeared at a most opportune moment, containing as it does an easily understood exposition of the subject. On one very small matter we venture to make a suggestion for a future edition. It is of assistance to practitioners if in the table of cases the references are given to where the cases appear in the reports. In the present volume these references are given where the cases are referred to in the text, but they are not brought out in the table of cases.

* "Rates and Rating: The Law and Practice of Rating for the Ratepayer and Rating Official." By Albert Crew, Barrister-at-Law, assisted by W. T. Creswell, Barrister-at-Law, Associate (late Fellow) of the Surveyors' Institution, and Arthur Hunnings, F.S.A. (London: Sir Isaac Pitman & Sons.) 1923. 7s. 6d. net.

ASSOCIATION OF BRITISH EXHIBITORS.

RAILWAY RATES.

Mr. A. T. B. Kell, of Messrs. Plaster Paint, Ltd., of 17, Percy-street, Tottenham Court-road, London, W.1, writes:—



Sir,—Before we can function properly as an Association, our Articles of Association must be approved by the Board of Trade, and their approval is shortly anticipated. In the meantime, we have in several directions already commenced our activities, and one in particular is of interest to many of your readers. In this direction we intend to tackle the question of carriage on goods in transit solely for exhibition purposes. With the exception of the annual shows of Agricultural Societies, the Smithfield Club Cattle Show and the British Dairy Farmers' Show who receive preferential treatment, the goods of the bulk of British exhibitors are rated to and from the various exhibitions as ordinary merchandise.

The preferential treatment referred to and received from the various railway groups is that the goods forming their exhibit are returned at half rates.

We think that this should apply to all exhibitors, and it is our aim to obtain this concession, both for the members of our Association and British exhibitors in general. It is essential that we have every possible backing in our efforts, and we hope it will be possible for such of your readers who are interested as exhibitors to lend their support and to signify their approval of our action by allowing us to add their names to our list of applicants for this privilege. In the event of their approving of our action, would they please send their names either to the Secretary of the Association at 69, Victoria-street, London, S.W.1, or to myself."

L.C.C. Central School of Arts and Crafts.

A course of lectures on "The History of Architecture" is being given on Wednesdays at 6 p.m. during the session just started at this school by Sir Banister Fletcher, F.R.I.B.A.

Scaffolding at Lowestoft Pier.

[This photograph shows scaffolding recently erected by Messrs. D. Leighton & Son, of Lowestoft. The diving platform is 67 ft. from the pier floor, the cycle track is 30 ft. high at one end and 40 ft. high at the other. This track is 68 ft. long. The base of the scaffolding is only 7 ft. 6 in. wide, owing to the difficulty of landing for the "Belle" steamers if it had been wider.]

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

AYR.—Plans passed by the Dean of Guild Court:—Double cottage, Ashgrove-street, Messrs. Wm. Govan & Sons, builders, Prestwick, £1,400; house, Somerset-road, Mr. Jas. Dickie, Victoria Stamping Works, £650; four double cottages, Lansdowne-road, Mr. R. W. Hutchison, builder, £4,800; four double cottages, Springbank-road, Messrs. Hart & Cumming, £5,000; seven dwelling-houses, Springbank-road, Messrs. Wm. Paton & Sons, £5,150; six dwelling-houses, Whitletts-road, Mr. Wm. Drinnan; six houses, Bellesleyhill-avenue, Mr. Robt. Stewart, joiner, Craigie-avenue, £4,300; six dwelling-houses, Springvale-road, Messrs. Wm. Paton & Sons, £4,800.

BURNLEY.—The T.C. Consultative and Co-ordination Committee recommend the approval of certain relief schemes subject to grants being obtained from the Unemployment Grants Committee. Amongst the proposals are the erection of a new central library, 50 more houses, and construction of roads on the Palace House site, excavations for the new plant proposed to be erected at Altham sewage works, construction of mains by the Electricity Committee, construction of a new road, and the installation of plant at Old Hall, the laying-out of the new portion of the cemetery and the asphalting of the roads in the old portion of the cemetery, the levelling and channelling of Stoneyholme. Hargher Clough, and Lowerhouse recreation grounds, the construction of a residuum lodge at Cant Clough and the Lowerhouse recreation grounds, the construction of four tennis-courts on Barden recreation ground, the construction of a bridge in Todmorden-road. The total estimated cost of the projects is about £250,000, and the T.C. is recommended to approve of the schemes. Several other schemes are also recommended.

BURRY PORT.—The U.D.C. proposes to erect new Central School at Pembrey, and Gorden Suburb inhabitants have petitioned Board of Education to also erect a school there.

CHELMSFORD.—Messrs. F. W. Gibbons & H. Davis, of Chelmsford, have in contemplation a scheme for the erection of 150 self-contained flats in the borough.

CRAMLINGTON.—The U.D.C., with Westslade U.D.C., has decided to bear an equal share of the cost of constructing a new bridge at Sandy Petch, total cost estimated at £1,000.

EDINBURGH.—The Burgh Engineer has been called upon to prepare a report for the consideration of the Corporation on the cost of a new pier at Portobello and of the extension of the promenade east and west.

ERPINGHAM.—The R.D.C. has received permission from the Ministry of Health to borrow £5,340 for the protection of the sewer outfall pipe and other coast protection work at Overstrand.

FALMOUTH.—Plans have been passed by the T.C. for a cinema to be erected in Market-street, next to the Royal Hotel, by Messrs. Harris Bros., the owners of two other picture theatres in the town. The new building, work on which is to be commenced at once, has been designed to seat 750 people and will be equipped in the most up-to-date manner. It is to cost £15,000.

FLEETWOOD.—Plans passed: Shop, corner of Poulton-road and Agnew-road, for W. C. Roskell; nine houses, The Esplanade, Roger Eaves; 12 houses, Agnew-road. Warren-avenue North and Warren-avenue South (subject to "B" type being amended so as not to exceed 950 square feet per house); two houses Dronsfield-road, for J. Walmsley.

HASLINGDEN.—The T.C. has approved plans for laying out pleasure grounds at Greenfields, at an estimated cost of £4,000. Application is to be made to the Unemployment Grants Committee for a grant equal to 65 per cent. of the interest and sinking fund charges for one-half the period of the loan.

HORSFORTH.—The U.D.C. is considering the erection of new baths.

HULL.—The T.C. has approved a scheme for the erection of a new central fire station in Worship-street at an estimated cost of £17,350. Tenders are to be invited.

KEIGHLEY.—The R.D.C. has decided to apply to the Ministry of Health for sanction to borrow £9,400 in connection with the proposed construction of a new reservoir at Lane Top, Sutton-in-Craven.

WATFORD.—A fire outbreak has destroyed the premises of the Marsh Chemical Plumbing Works, the Textile Flexible Tube Company, and the Van Kannel Revolving Door Company.

Drury Lane Theatre.

Judging from the reception with which "Good Luck," the new sporting drama by Seymour Hicks and Ian Hay, was received on Thursday, last week, it would appear that Mr. Arthur Collins has backed a winner, to express oneself in a racing term, which is perhaps not inappropriate on this occasion. The whole play is well staged, but when is a play not well staged at the historic Lane? It sparkles with witty racing expressions, all apparently well understood by the audience, judging from the merriment with which they were received. The sensations of the play, which are always looked for and marvelled at, are the accident to the motor car of Lord Trenton, the race for the Hunt Cup, in which racehorses take part, and the success of Eleventh Hour, the favourite, furnish exciting scenes. In addition, the breaking-up and sinking of the yacht on which the villain, D'Arcy Bristowe, and the heroine, Lady Angela Vale, are aboard, is a thrilling moment, and one wonders how it is done. This realistic scene is a marvel of stagecraft, and the players—to quote an expression in common use amongst our readers—are "all the best of their respective kinds," and it would be unjust to mention individuals.

Town Planning.

The Bournville Village Trust Lectures in Civic Design and Town Planning during the 1923-24 session, in connection with the University of Birmingham, will commence on October 16 with a series of ten lectures by Mr. William Haywood, F.R.I.B.A., M.T.P.I. The second series will be given by Mr. H. H. Humphries, M.Inst.C.E.; Mr. John Robertson, C.B.E., M.D., B.Sc., and Mr. Francis C. Minshull, LL.M., Chief Assistant Solicitor, City of Birmingham. The third series, numbering 20 lectures, will be given by Mr. Wm. Haywood. The first and second series of lectures will be given at Edmund-street at 6 p.m. on Tuesdays, and the third series at the University, Edgbaston, on Mondays, at 11.30 a.m. The public will be admitted, without fee, to any of the series of lectures, and those attending the third series can take, if they so desire, the class work courses or either of them. A fee of £1 1s. is charged for the class work courses.

NEW BUILDINGS IN SCOTLAND.

Elgin.—Houses.—At the last meeting of the Moray County Council at Elgin it was intimated that the Board of Health have granted permission to the Council to erect four more houses.

Paisley.—Houses.—The T.C. has authorised the Housing Sub-Committee to obtain tenders for the erection of 100 houses at Whitehaugh. Plans have been approved for a villa at Southfield-avenue, Potterhill, Paisley, for Mr. James Adie, Ayr.

Glasgow.—Housing.—The Corporation has been recommended to enlarge and complete the housing scheme at Knightswood by the purchase of land at Bankhead for building purposes at a cost of over £50,000.

Croydon.—Houses.—The T.C. recently passed a scheme for the erection of 182 houses on three sites. The National Executive to the Labour Party is promoting a deputation to the Ministry to urge the need for 5,000 houses.

Paisley.—Tenements.—The T.C. is negotiating for sites for the erection of tenements in connection with the insanitary, areas scheme

Dalkeith.—Houses.—A start has been made on the site at Elmfield Park, where the T.C. propose to erect a tenement of 24 working-class dwellings.

Bonnybridge.—Cottages.—The Eastern District Committee of Stirlingshire County Council has passed plans for 12 cottages at Allandale, Bonnybridge.

Greenock.—Slaughter-house.—The Corporation Law and Finance Committee propose to reconstruct the slaughter-house or erect a new one at a cost of £11,500.

Kirkcaldy.—At a meeting of Fife Education Authority it was decided to remit to a special committee for report on the provision of education buildings in the area.

Larbert.—Dwellings.—At a meeting of the Eastern District Committee of Stirlingshire County Council plans were passed for two dwellings at Newhall-road, and a bungalow at South Broomage, Larbert.

Gourock.—Bungalows.—Mr. W. Steele, of Tarbet, has started building four bungalows on the Cloch-road. These are the first instalment of a scheme of houses leading down to McInroy's Point.

Dunfermline.—Villa.—The Dean of Guild Court has passed plans submitted by Mr. T. Millar, 61, Broad-street, Cowdenbeath, for a large villa at Garvock-hill, and by Mr. P. MacDonald for a house of the bungalow type at Touch.

Grangemouth.—Houses.—The T.C. has approved plans submitted by Messrs. Wilson & Tair, architects, on behalf of the Grangemouth Co-operative Building and Investment Society, Ltd., for two blocks of houses.

Stonehaven.—Houses.—The T.C. has passed plans submitted by Mr. J. Ellis, architect, Stonehaven, for eight villas on the Westfield-road; Messrs. D. & J. R. McMillan, Aberdeen, for 12 houses in Victoria-street; and Mr. R. Dunbar, for a cottage at the Mill of Cowie.

Stenhousemuir.—Church Hall, &c.—The Eastern District Committee of Stirlingshire County Council has passed plans for a committee room, recreation room, and church hall at Main-street, Stenhousemuir.

Edinburgh.—Creamery.—Plans prepared by Mr. M. Purdon Smith, architect and surveyor, Tower-buildings, High-street, Lockerbie, were passed by the Edinburgh Dean of Guild Court for a new creamery at West Bryson-road, for the Edinburgh and Dumfriesshire Dairy Co., Ltd.

Factory Extensions.

TRADE NEWS.

ew catalogue issued by Messrs. A. Emanuel ns, Ltd., of 7–13, George-street, Manchester-re, W. 1, entitled "Some Up-to-date ary Fittings for Modern Houses," contains ection of baths, lavatory basins, mirrors of ent shapes, medicine cabinets, w.c. pedes- and cisterns, chairs, sinks for many pur-, urinals, taps, and bathroom accessories. of the designs, especially of the baths avatories, are of an attractive appearance, embody several new features. Practically whole of the earthenware and fittings are ed in white porcelain enamel, and will have an added appeal to those concerned labour-saving in the home. All the items l are illustrated and useful details are in connection with the articles to assist ection without unnecessary trouble. Messrs. nuel have an extensive showroom at George-t, to which architects and others interested nitary fittings are invited.

those who appreciate the appearance of rquet or hardwood-block floor, a pamphlet d by Messrs. H. G. Morner & Co., of 54A, ament-street, S.W. 1, will be of interest. pamphlet describes and illustrates a patent parquet floor covering which is only ¼ in. , and when laid gives a hardwood surface considerably lower cost than a solid hard-l floor. The "P.P.P." flooring, as it is d, is supplied in sheets 1 ft. 11 in. by 11 in., and is composed of best oak, three-enths of an inch thick, glued to a wood er. The jointing of the sheets is un-eable, and the material is easy to lay. material is made in three standard patterns, can be supplied in any desired pattern.

complete and well-produced catalogue of surveying and drawing instruments and iances has been issued by Messrs. C. F. lla & Co., Ltd., of 49 and 50, Parliament-t, London, S.W.1.

uthgate U.D.C. (Surveyor, Mr. R. R. Phillips) ndertaking extensive roadway surfacing s with "Asphaltic Slag for Roads," the ed tarmacadam manufactured and supplied essrs. William Shepherd & Sons, Ltd., Milk-, Rochdale.

ssrs. Munro, builders and decorative con-ors, have transferred their head offices 8, Thayer-street, Manchester-square, W.1, 3, Baker-street, Portman-square, W.1, hone number remaining as before—ham 2998.

e Directors of Bell's United Asbestos Co., have declared an interim dividend on the ary shares of sixpence per share, less income or the current year. The dividend will be on the 22nd inst. to shareholders on the er on October 6, and the ordinary share fer books will be closed from the 6th to the inst., both dates inclusive.

are informed by Messrs. Petters, Ltd., l, that at the Mandalay Agricultural ition and Conference (the most important ition of its kind in Burma), which closed on st 25, they were awarded a silver medal ertificate (highest award) for the exhibit eir oil engines. The exhibit included a of engines of the medium compression the first medium compression engines to instantly from cold without pre-heating he usual starting-lamp and without cal equipment of any kind. The Governor rma visited the exhibition, and the Com-s representatives, Messrs. A. Scott & Co., he pleasure of escorting him round their This device was awarded the silver (highest award) of the R.A.S.E. at New-in July of the present year.

Silver Wedding.

ncillor F. W. Goodyear, builder and con-r, and Mrs. Goodyear, of The Gables, m, have just celebrated their silver ng. Councillor Goodyear has been asso-with the Durham City Council for fifteen and is Mayor of that city.

ERPINGHAM.—For building sea-wall at Overstrand, for the R.D.C. :—
*J. Youngs & Son, Norwich..... £1,717

GALASHIELS.—For the reconstruction of Buckholmside Skin Works, for Messrs. Murray & Sanderson, Ltd.: Asphalte work to roofs, floors, and gutters :—
*Tunstall's Rock Asphalte Co., Ltd., Leeds £484

GLASGOW.—For the supply of two sets of turbo-alternators for the Dalmarnock Power Station, for the Corporation Electricity Committee :—
‡C. A. Parson, Ltd., Wallsend—£90 000 per set.

GLASGOW.—For the supply of a high tension switch gear at the Dalmarnock Power Station, for the Corporation Electricity Committee :—
‡Reyrolle & Co., Ltd., Gateshead..... £34,000

KIRKBURTON.—For erection of a school. Messrs J. Berry & Sons, architects, 3, Market-place, Huddersfield :—
Mason and concreter—Swift Bros.
Joiner—W. A. Jones.
Plumber—H. C. Stringer.
Plasterer and slater—T. B. Tunnacliffe.
Painter—T. W. Spivey.
Steelwork—J. Taylor & Sons.
Heating—T. H. Rayner & Son.
All of Huddersfield.

LEEDS.—For the erection of new filling station in Woodhouse-lane, for Messrs. Rowland Winn, automobile engineers :—
*Wm. Irwin & Co., Leeds.

LLAY.—For the erection of St. Martin's Church, Llay, Gresford. Mr. R. T. Beckett, architect, Tryddyn, near Mold. Quantities by Messrs. Law & Son, 51, North John-street, Liverpool :—

R. Randles, Marford—		
No. 1	£5,203 10 0	
No. 2	4,616 6 9	
Whole church		£9,819 17 5
Merritt, Willaston—		
No. 1	£5,053 0 0	
No. 2	4,398 0 0	
Whole church		£9,451 0 0
Morrison & Sons, Wavertree—		
No. 1	£4,932 0 0	
No. 2	4,278 0 0	
Whole church		£9,210 0 0
J. Thompson & Son, Peterborough—		
No. 1	£4,726 0 0	
No. 2	4,151 0 0	
Whole church		£8,877 0 0
J. T. Jones, Cefn		
No. 1	£4,742 0 0	
No. 2	4,126 0 0	
Whole church		£8,868 0 0
P. Edwards, Dodleston—		
*No. 1	£4,700 0 0*	
No. 2	3,950 0 0	
Whole church		£8,650 0 0

LONDON.—Adaptation of the Wellington-road as a tuberculosis dispensary, for the Poplar B.C. :—
*Truscott £647

LONDON.—For erection of sub-station at junction of Blythe-road, for the Hammersmith B.C. :—

G. Holland & Sons	£450
J. Mowlem & Co., Ltd.	439
J. McManus, Ltd.	322
N. Green & Co., Ltd.	300
G. W. Clarke	269
*Kinnear, Moodie & Co.	240

LONDON.—For laying condensing water discharge pipe, for the Hammersmith B.C. :—

J. Mowlem & Co., Ltd.	£3,400 0 0
J. Price	2,700 0 0
Leslie & Co., Ltd.	1,571 0 0
Kinnear, Moodie & Co.	1,490 0 0
J. Cochrane & Sons, Ltd.	1,100 0 0
*G. Webb & Co.	556 2 8

LONDON.—For resurfacing Victoria Park-road with "Duraphalt," for the Hackney B.C. :—
*Whitehall Asphalt & Engineering Co. 7s 5d. per sq. yard, with free maintenance for five years.

LONDON.—For repairs, &c., at Kensal-road baths, for the Paddington B.C. :—
*W. Giles..... £242 6 9

MARLBOROUGH.—For the erection of seven cottages, for the T.C. :—

Minty & Swatton	£4,256
A. Martin	3,892
C. Simons & Son, Calne	3,591
Hillier & Sons	3,450
W. E. Piper & Son,	3,348
Saunders, Cirencester	3,143

NORTHAMPTON.—For the T.C. :—
22 "B3" and 64 "A3" houses, Far Cotton site—*A. L. & H. W. Chown, Northampton—£37,932.
Eight "B3" and eight "A3" houses, Far Cotton site—*A. Glen & Son, Northampton—£7,415.
Total: 102 houses. Cost: £44,347.

NORTHAMPTON.—Relaying electric tram-track Kettering-road and Gold-street, for the T.C. :—
*G. F. Hartigan, Marlborough—£6,469 19s. 7d.

PRESTON.—For the erection of a sub-station at Ribbleton, for the T.C. :—
*J. Turner £871 12 9

PRESTON.—Erection of extension to Deepdale Council School, for the T.C. :—
*G. Hill & Sons £2,551 19

SALFORD.—For supply of various materials to the Highway and Paving Committee of the T.C. :—

*John Crankshaw Co., Ltd., Horwich—Earthenware pipes	£180 3 0
*B. Carrington Sellars, Manchester—200 tons Portland cement	575 0 0
*James Schofield & Sons (Mossley), Ltd., Mossley—Castings	80 16 6
*The Buxton Lime Firms Co., Ltd., Buxton—Limestone chippings	183 15 0
*Rudman & Phillipson, Entwistle—Best Barns flags	140 0 0
*Thomas Ratcliffe, Bacup—Rochdale curbs	291 5 0
*Isaac Law, Shawforth, near Rochdale—Rochdale curb edging	30 15 0
*Charles H. Phillips, Manchester—200 tons stone chippings	125 0 0
*John J. Lee, Manchester—Tarred slag	664 5 0
*Partington Steel & Iron Co., Ltd., Irlam—Tarred slag	584 10 0
*Penmaenmawr & Welsh Granite Co., Ltd., Liverpool—2,500 tons granite setts, at 59s. 9d. per ton, and 75 tons ¼ in. granite chippings, at 17s. per ton	7,532 10 0

SALFORD.—For widening of Stott-lane, including erection of girder bridge over railway, &c., for the T.C. :—

*T. Wrigley, Manchester..... £20,923 8 10

SOUTH SHIELDS.—For erection of 50 bungalow-type houses, for the T.C. :—

*Wholesale Co-operative Society.... £22,000

TILBURY.—For repairs and redecoration to the Station Restaurant, Tilbury Docks. Mr. William Gilbert, M.S.A., architect, 74, Broad-street-avenue, E.C.2 :—

Johnson Bros.	£1,128
Dearing & Co.	1,100
Schooley & Son	990
Snewin Bros.	970
*Vigor & Co.	925

TILBURY.—For repairs and redecoration to the Basin Tavern, Tilbury Docks, Mr. William Gilbert, M.S.A., architect, 74, Broad-street-avenue, E.C.2 :—

Dearing & Co.	£655
Johnson Bros.	640
Vigor & Co.	535
Schooley & Son	485
*Snewin Bros.	447

WHARFEDALE (YORKS).—For new roadway leading from main road to the Small-Pox Hospital, for the Hospital Committee :—

*John Parker, Horsforth..... £709

WILLESDEN.—For (1) tar macadam works at Tubbs-road and Neasden-lane, (2) paving works, Acton-lane, (3) renewal of wood paving, Canterbury-road, for the B.C. :—

*(1) T. W. Heath (Public Works), Ltd., 7s. 3d. per yd., super.
*(2) C. V. Buchan & Co., granite setts, at 22s. per yd., super.
*(3) Acme Flooring & Paving Co. (1904), Ltd., at 16s. per yd., super.

WORCESTER.—For the reconstruction of Bransford Bridge (new ferro-concrete structure), for the Corporation :—

*T. Vale & Sons, Ltd., Stourport.. £9,255 9 6

St. Catherine's Church, Hammersmith.

With reference to the description of the above in *The Builder* of August 14, we are asked to state that the material for the acoustical treatment of the building was furnished by Building Products, Ltd., of Columbia House, 44–46, King's-road, Sloane-square, S.W. 3.

"Electric Cranes."

"Electric Cranes," a neatly bound book issued at 2s. 6d. by Sir Isaac Pitman, Ltd., describes the construction and operation of modern cranes, transporters, capstans, winches, haulages, winding gear, &c. The author is F. E. Chilton, and the information given should be of use to works and railway officials, engineers, operators and students.

Building Materials for Japan.

A report has been prepared in the Department of Overseas Trade on the market in Osaka, Japan, for building materials, based on information furnished by the Acting British Consul at Osaka, before the recent earthquake in Japan. A copy of this report, together with the names of importers of building materials in Osaka, may be obtained by interested British firms on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

TOWN PLANNING.

"THE old order changeth, giving place to the new." Such indeed should be the guiding thought of the days in which we live—in this strange, kaleidoscopic period, when in every art, science, trade or conditions are gradually changing—sometimes imptibly, sometimes with a rapidity which savours of a tion. And in no direction is this metamorphosis more kable than in the demand for better planning of our and industrial areas; widespread, insistent, there is this (not only in our own land, but universally) for something than the bare necessities of shelter and protection from ements—for the amenities of life, for beauty, for order, bove all, for a plan: the logical disposition of a town or to the best advantage of its inhabitants. It is a call, er cry of the worker, for something which has hitherto acking, something which will give him beauty. A call, , to the imagination of those who have studied the vital t of town planning.

e recent successful meeting of the Town-Planning Institute rk, which gives rise to these remarks, inspires both con- and some misgivings. Confidence, because most of who have made a study of the art or science of town- ng are inspired by high ideals, or fully appreciate the lities of improving the appalling conditions of industrial as these exist to-day. Misgivings, because, in practice, lisation of the ideal falls far short of the original inspira- because, too often, moral courage is lacking in the facing culties resolutely and squarely; because again (in some the development of important and historic cities is left who lack imagination and vision and who, in conse- neglect great opportunities and lightly undertake the anning of a city without preliminary investigation of estions, such as traffic surveys, the delimitation of un- areas, the consideration of site and contours, the gations necessary to deal with the problem of "zoning," ion but a few of the questions which must be thoroughly curately appreciated before a town-planning scheme of the name can be prepared.

perly understood, town planning should improve not e health of the community, but should greatly increase mant faculties of the appreciation of beauty, the civic nd the general well-being of the citizens of England. -product it should, necessarily, develop the efficiency of ker, whether intellectual or manual, by increasing his ect, by the provision of healthy and beautiful sur- gs, sunlight and fresh air. Therefore—as many wise rs now realise—town planning is a paying proposition. it is not always appreciated is the difference between a assable" scheme, which satisfies the minimum require- nd a really imaginative plan.

Town planning is, perhaps, a science in so far as it is the logical solution of a definite set of problems. But it is also an art, and, like all creative works, must—to attain its highest form—be based not only on precise and accurate data, but must also be inspired by the imagination of the artist. It is not sufficient to trace certain lines on an ordnance map which will provide routes for motor traffic, to devise a system of tramways and to plan a sewage system. In addition to these requirements what is necessary is to create an atmosphere, to give a personality to the town, such as will encourage the growth of civic pride, focus the interests of the inhabitants on their town or city, and foster the development of that appreciation of beauty and fitness which has, in too many cases, become atrophied in the denizens of our industrial centres.

One could wish that the Town-Planning Institute would adopt a most definite propaganda in favour of these essential ideals. The decision taken some years ago to hold annual conferences in various provincial towns has been of great value in assisting the cause of town planning in this country, and, in particular, the meeting held in Manchester last year stimulated a great public interest in the subject which had previously remained latent and, for the most part, unsuspected in the great industrial community of South-East Lancashire; the exhibition (which was held at the same time) greatly assisted in this successful stirring of the popular interest, and we could wish that at future meetings of the Institute an exhibition of this kind should always be arranged, even if many of the exhibits had previously been seen either in London or elsewhere, because plans and diagrams (even when imperfectly understood) make an instantaneous appeal to the popular mind, and, if carefully studied, illustrate the principles of town planning far better than lectures and papers on this subject. The graphic presentation of civic centres, agricultural belts, or even traffic and "time" diagrams, appeal to the imagination—which, after all, is the essential aim in propaganda—whereas the paper read in the lecture room is often either too concise to be readily understood by the layman or so lengthy that it wearies him.

In conclusion, and from the point of view of the technician who requires definite guidance, it might be advisable to prepare, for such annual conferences, definite pronouncements on questions of difficulty, such, for example, as the constantly recurring questions of the maintenance of grass margins to roads where the whole width is not macadamised, the best position for tramways on main arteries, the planting of trees and avenues, the planning of busy road junctions, or the factors to be considered in "zoning." In fact a preliminary study of the local difficulties of the centre selected for the annual conference would probably be expedient and would add considerably to the value of the subsequent meeting as propaganda, which is the most important and valuable function of such gatherings.

NOTES.

Crowland Bridge. The appeal which has been made for the preservation of this triangular fourteenth-century bridge near Peterborough, which is of a specially interesting character, will, we trust, lead to funds being quickly forthcoming to execute the necessary repairs. It is difficult to understand why so fine a bridge should have been allowed to fall into such disrepair, and it is satisfactory to know that the present direction is towards a more reverent care of such landmarks, as forming part of an ancient patrimony of which we are trustees. An earlier authority however (about 1800), to which we have had access, gives a different appellation to the large stone figure, which, in the appeal to which we have referred, is described as a figure of Christ. In this account of the streets of Crowland we are told "they are connected by means of a curious triangular bridge formed of three segments of a circle, meeting at a point in the centre, but so steep that only foot passengers can pass over. . . . On the south-west wing, which faces the London road, is a stately image of King Ethelbald, supposed to have been erected about the year 860." From this it would appear that the statue is not that of Christ, and the figure itself rather suggests that of a Saxon king. We should be interested to know the source of the present attribution.

The Local Industry. We have not the particulars enabling us to form an estimate of the extent to which the small workshop on handcraft lines is multiplying itself locally, but that there is a tendency for these local industries to increase is all to the good, and disputes the view that craftsmanship of this traditional kind is ceasing to exist. Every encouragement should be given to such activities, because of their advantage to use, health, economy and beauty—to use, because the thing made is better; to health, because the conditions of such labour are so improved; to economy, because not only is the work more lasting, but it includes the far larger and fundamental economy of using 100 per cent. of the craftsman, instead of the 20 per cent. or even less which is used of him in the factory. The contentment arising out of this makes of him also a better citizen, while labour carried out on such lines should not deface the countryside. It is difficult at present for a craftsman single-handed to carry on in such a way, but by combining together they should be able to do so, while this more corporate aim is all to the strengthening of their work and to the consolidation of country life. So we wish success to the small industry with its more humane standards for labour, which give freedom to the craftsman to use the whole of himself intelligently. There is nothing that demonstrates more that our values are wrong than that it should appear to be an economic law which permits of this loss, and that we can find it accepted that this is necessary to it is surely in itself a great condemnation.

Decorative Textiles. The best criterion of the condition of public taste can be found in the windows of the provincial shopping town; and it is therefore gratifying to note the great improvement in the design and ran colour of materials now being exhi for curtains and upholstery. A few ago the conventional flowered and J ean wall-papers and cretonnes supplanted by the stereotyped pa indefinite pinks, greys, and ma often contrasted with black cush There is now visible a refreshing tend to revert to simple stripes in brave co reminiscent of Arab work. A good of the value of the colour and desig such accessories can be found by s whether they are in harmony with oriental carpets. The latter prese vigour and strength in design that d harmonise with "sloppy" work or aff and unwholesome "moods." No can better enliven a dull street than bright curtains, even if they err o side of gawdiness. We hope that tendency to an emphasis of colou spread from the interior to the ex of the house.

The Passing of the Country Roads. We should hardly have so far as a leader-wri *The Times* who, in writ the destruction of the co roads through motor traffic, says, process can hardly be stopped. A d or two more and we must search the of distant countries for a truly co road." We do not take the view because our country districts are in and injured that they will always Abuses do tend to cure themselves so much through legislation as a c of mind—and we do not believe th shall continue to care quite for the things. No doubt the beauties th defaced are little missed by the mo because he does not see them. The thing which drives him ever farth farther in the endless pursuit of som which never satisfies because he possesses it, the victim of his own ometer, will be replaced by values o reality. With the commercial traffic it is no doubt different, and w have to be content to yield our roads to its requirements. But present time the motor-car in people flee to enjoy a couple of run in the quiet of the country is far changing the character of the c roads that the object can hard secured, for, in consequence immense traffic, roads have to be w grassy verges cut away, hedges an cut down, and corners extended, a uncommonly a hard stone verge r the pleasant grass of the path's ed borders the road. It is, howeve that more organised protection wer coming for pedestrians and other the country roads, including th inhabitants; and it is surely poss announce in a less strident and becoming way that motor spirit is able, for at present nothing co uglier or more offensive.

ectures n Recent cavations

The series of lectures by Miss Claire Gaudet, the first of which was given last Thursday in the Lecture Room at British Museum, opens out a subject m which recent excavations enable us learn not only so much more about ient civilisations, but of the evolution he past which is seen to be continuous. Sir Arthur Evans tells us, all civilisas were interwoven. The radiate or e arch is contemporaneous with the t cuneiform, about 4000 B.C. We see growth of construction from the iest times, so extending our concepas as to the origins of architectural n. This continuous evolution reminds hat the dark places between identify nselves with those periods when the ages of war reduced humanity to the est struggle for existence, reminding of some recent words of Sir Edward y as to the effects of war on Euron civilisation. Recent discoveries in ylonia and Mesopotamia have filled in ain gaps and show us that Sumerian lisation spread from the former to pt. These recent discoveries alter our vs as to the Egyptian being a detached lisation, and show the interdependence ll civilisations. These most interestlectures are to be continued every rsday afternoon at 4.30.

Restoration of "Old Masters."

It may be pointed out here that, in the view of any really able practising artist, pictures which have been entirely overpainted in oil, as described in an account of some newly discovered "old masters," are very much reduced from their original quality, and that the loss entailed by such overpainting is not to be recovered by restoration, for the freshness and charm of the original treatment will have been much vitiated in the process. We do not undervalue such pictures in saying that they should be valuable to us for intrinsic reasons and not for their names, through which they are so much exploited. We think the time has come to look a little askance at "old masters" unless they include the rare and unmistakable greatness which belongs to the best of them. We remember years ago hearing of a man whose entire occupation was that of painting spurious Morland's, and we should tread our way most carefully in a market which includes more commercial initiative than art.

The "Wonky" Cottage.

If the old-time ruler required his court jester, democracy to-day likewise demands its humorous commentary of life. Mr. Punch always admirably reflects the club Englishman, and the illustrations of a "wonky" cottage and the trials entailed in living therein that appeared in a recent issue must have gone home to many readers. The charm of the old cottage, with its low doorways, inadequate windows, and leaning chimneys cannot be denied, and we cannot attribute the present-day craze for such dwellings either to affectation or entirely to the pressure of necessity. Despite its inconveniences the old cottage has an important part to play and a lesson to teach in solidity of construction and simplicity of design. It is easy to ride "modern amenities" to death, and the love of the old cottage should act as a steadying influence to a generation whose traditions have, for the most part, been rudely shattered. But the love of the antique has its dangerous side, and we must beware of building sham antiquities. Our restorations should be in keeping with the original work, but our new houses should be frankly new and good at the same time.

Current Information on Town-Planning.

It has always been a difficulty with town-planning officials to obtain authentic information on current problems, but we understand that the North of England Division of the Town-Planning Institute is making an effort to provide this by obtaining a record of activities in their area with such information as to cost and peculiar difficulties which might be of assistance to authorities preparing schemes. No doubt we shall see what form this will take in the course of the next few weeks, but if town-planning officers will co-operate it seems possible that the result might be most useful to themselves and the profession at large.

Spandrel for the Exterior Arches of the Palace of Machinery, Panama Pacific International Exposition. Mr. Haig Patigian, Sculptor. (*See p.* 561.)

GENERAL NEWS.

Professional Announcements.

The offices of Messrs. Percy Tubbs, Son & Duncan, architects and surveyors, are now at No. 30, John-street, Bedford-row, W.C.1, and their new telephone number is Museum 5809.

The address of Messrs. J. Murray Easton and Howard Robertson, architects, is now 36, Bedford-square, London, W.C.1. Telephone Museum 6424.

Mr. Harold Burleigh, A.R.I.B.A., architect and surveyor, has taken an office at 81, London-road, St. Leonards-on-Sea (Telephone : Hastings 1234), and will be pleased to receive manufacturers' catalogues.

Mr. W. Hamilton Fearnley, architect and surveyor, of Featherstone, who closed his office in 1916 for war service, has now resumed his practice in Station-lane, Featherstone.

Change of Address.

The address of the Edinburgh Architectural Association is now 15, Rutland-square, Edinburgh.

J.P. for Devon.

Mr. Thomas Abell, of 8, Rolle-street, Exmouth, who has been appointed a J.P. for Devon, is a member of a well-known firm of builders and contractors, has lived at Exmouth nearly half a century, and for over 34 years has been a member of the Urban District Council.

Water Fittings.

A meeting is to be held at Connaught Rooms, Great Queen-street, W.C., on October 17, at 2.15 p.m., for the purpose of considering proposals for the formation of an association to protect the interests of manufacturers of water fittings. Several influential bodies, representing builders and property owners, have signified their intention of being represented at the meeting.

Ancient Kentish Manor House.

A fourteenth century manor house has been discovered at Sundridge, Kent, during the restoration of three cottages between Riverhead and Brasted. At the request of Mr. C. P. Munn, a Hampstead builder, who bought them to convert into one house, Professor Beresford Pite has prepared plans for the restoration of the premises. Already many of the original features of the building have been exposed on the removal of the outer plaster and brickwork.

Chester Cathedral.

During excavations in the eastern cloister at Chester Cathedral, for laying an electricity cable, a floor laid with Roman tiles was unearthed about 9 in. below the existing level. About eight tiles of the Roman type, 8 in. square and 2 in. deep, made of plain rough clay, were found. In 1915 Mr. Geo. W. Haswell, F.S.A., read a paper before the Chester and North Wales Archæological Society on the subject of the Abbey Church of St. Werburgh in pre-Norman times. In this he put forward the suggestion that two built-up arch openings in the eastern wall above the pavement formed the entrance to the early Christian Church of St. Peter and St. Paul, into which the remains of St. Werburgh were brought in 875.

Reading College Library.

A new library, presented to University College, Reading, by the Palmer family, was formally opened on Saturday by the Earl of Crawford, Chancellor of Manchester University. It has been erected as a memorial to the late Right Hon. George William Palmer, a former vice-president of the college, and one of its principal benefactors. The library, which was designed by the late Mr. C. Steward Smith and Mr. Harry Hutt, is planned with an entrance hall, paved with black and white squares, out of which open the Overstone Library of 7,500 volumes, bequeathed by the late Lady Wantage ; a room for future extension, with shelving for 6,500 volumes, and a smaller room, with shelving capacity for 3,500 volumes. The upper floor is approached by a broad stone staircase, with bronze and marble hand-rails.

Galashiels War Memorial.

At a meeting of Galashiels War Memorial Committee the sub-committee's report showed that the estimates were considerably in excess of the funds at the Committee's disposal, and Sir Robert Lorimer was asked to go over the schedules in order that, while still maintaining the same effect, but without too much elaboration, the memorial might be modified. This had been done, and the lowest estimates now gave a total of £19,933. The sub-committee also submitted photographs of an equestrian group designed by Mr. Clapperton, sculptor, which they thought should be included in the scheme. The additional cost of this group was estimated at £1,500, bringing the grand total up to £21,433. The amount available if all outstanding subscriptions promised are paid is £17,429 1s. 8d., leaving a deficiency of £4,003 18s. 4d. The sub-committee recommended that the scheme be proceeded with, that the equestrian group be included, and that the Town Council be asked for their approval. The General Committee approved, and delegated full powers to the sub-committee.

Egyptian Architecture.

Sir Banister Fletcher, F.R.I.B.A., gave an interesting lecture on Egyptian architecture at the Central School of Arts and Crafts on Wednesday last week. He outlined the influences which controlled the architecture, to understand which, he said, one must enter into the spirit of their religious beliefs, and appreciate their social conditions, besides giving due importance to the unusual geographical, geological, and climatic conditions of that strange land. The pyramids, the greatest monuments of antiquity that had come down to us, were the result of the Egyptian belief in immortality, for in them they sought to preserve the body for the return of the soul. Then, too, the powerful priesthood upheld the traditional, mysterious and unchangeable religious rites, reflected in the planning of the temples. A sketch of the life of Egypt in early days was followed by a review of its history from the time of the first dynastic king, 6,000 years ago, to the present day.

Sir Banister then described the features which characterise the buildings of the Nile, referring in turn to the planning of the temples, sloping walls (giving an appearance of strength) often incised with sculptured scenes, the imposing colonnades with their wonderful variety of sculptured capitals, and finally a sketch of Egyptian ornament, from the pa[in]tings, scenes and symbols down to the treatment of domestic furniture. This study of the life of the Egyptians will be continued in Wednesday's lecture, when the Sphinx, the pyramid and other tombs will be described in detail, including some reference to the discovery of the Tomb of Tutankhamen.

(See Paper by Mr. F. C. Mears on page 577.)

A "Chequer" Town in the Seventeenth Century : Showing Detached Cottages and Gardens.

COMPETITION NE[WS]

Greenwich Baths Competition.

As briefly announced in a portion o[f the] edition last week, Mr. Ashley, the assesso[r] made the following awards in the above [com]petition :—1, Messrs. F. J. Horth an[d] Andrew, Custom House Buildings, White[hall] gate, Hull ; 2, Messrs. H. Field and [J.] Pearson, 5, Gower-street, W.C.1 ; 3, [Mr.] F. B. Mennie and C. D. Smith, 11, New[Sq.] Lincoln's Inn, W.C.2. The designs placed [first] and second are illustrated in this issue.

Newtown War Memorial.

The Newtown War Memorial Comm[ittee] invite designs and estimates for the erection [of a] suitable memorial. Full particulars may be obtained from the Secretaries, Council C[hamber], Newtown, and all designs, &c., must be in [the] hands on or before October 29.

Holmside.

The President of the R.I.B.A. has nomi[nated] Mr. T. R. Milburn, F.R.I.B.A., as assess[or] the Holmside and South Moor Collieries C[ottage] Hospital Competition.

Cost of Building Competition.—No. I[I].

Owing to the indisposition of the assess[or] regret that delay has occurred in coming [to a] decision in this competition.

Other Competitions.

Other competitions still open includ[e the] following (the dates given are, first the se[t] in date, and second the issue of *The Build[er]* which full particulars were given) :—Sing[ing] College (Jan. 1, 1924 ; March 30). Hul[l] Gallery (Nov. 5 ; May 4). D.I.C. E[xt.] Manchester (Oct. 15 ; Sept. 7). Chiswick [Em]bankment—*Banned by R.I.B.A.* (Oct. 15 ; [Nov.] 7). Dudley Memorial (Jan. 5, 1924 ; Sept[.] Eastleigh and Bishopstoke Assembly H[alls] *Banned by R.I.B.A.* (Dec. 3 ; August[.] Taunton War Memorial (Nov. 30 ; Oc[t.] Memorials to the Missing (Jan. 1, 1924 ; Au[g.] Southsea Lay-out (Oct. 20 ; Oct. 5)—*B[anned] by R.I.B.A.* Limehurst Bridge (Oct. [20] Oct. 5).

MEETINGS.

Friday, *October* 12.

National Federation of House Builders.—[An]yearly Meeting. At Municipal Offices, H[ig]gate. 11 a.m.

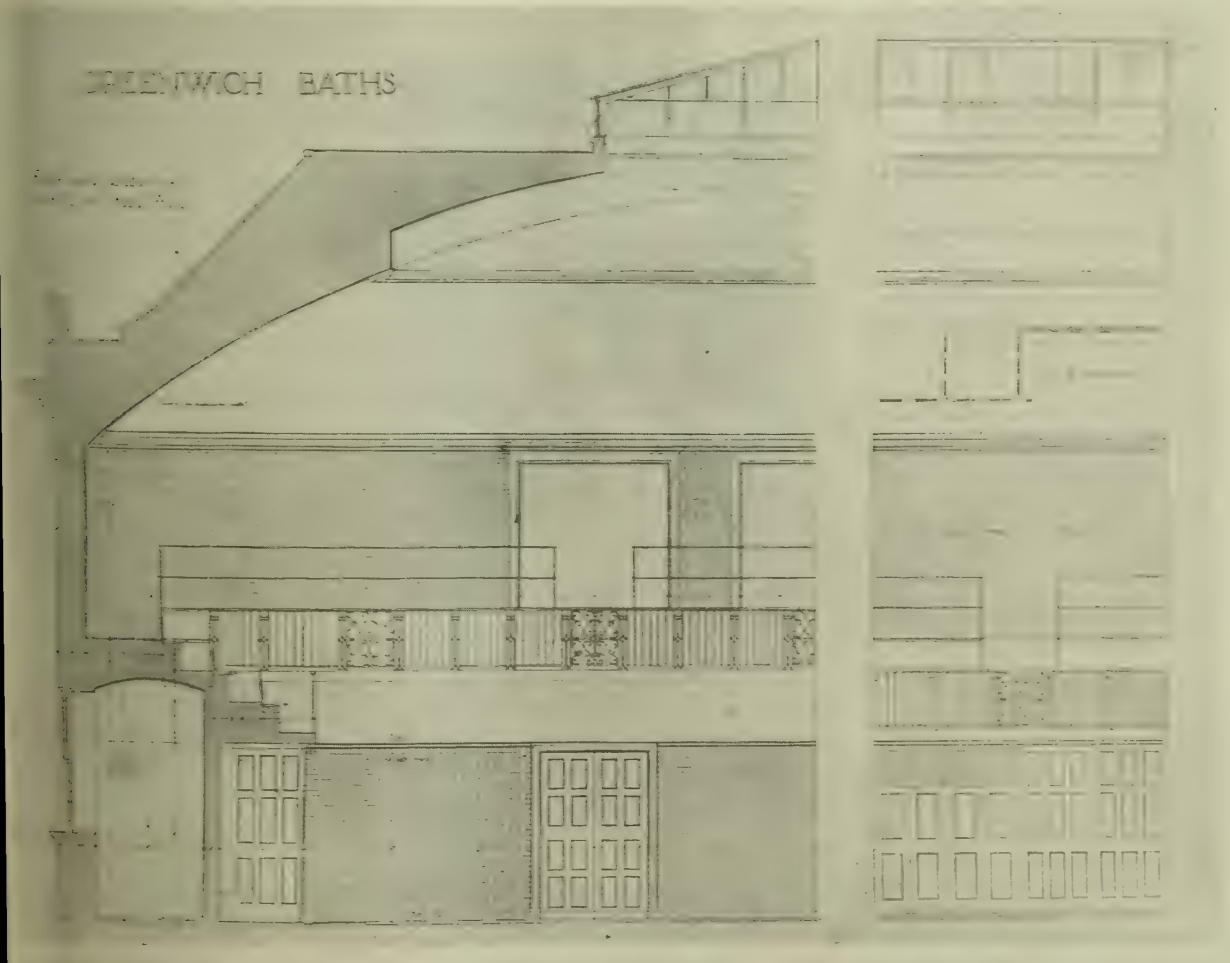
Royal Sanitary Institute.—Mr. Percy D[ar]on "Some Aspects of Housing in Carlisle." [At] the Town Hall, Carlisle. 7.30 p.m.

Saturday, *October* 13.

Institution of Structural Engineers.—Vi[sit] view progress of works at the British E[m]pire Exhibition, Wembley. At 2.15 p.m.

Wednesday, *October* 17.

L.C.C. Central School of Arts and Crafts.—[Sir] Banister Fletcher on "The Sphinx : [Its] Pyramids and Other Tombs." At South[am]pton-row, W.C. 6 p.m.



THS AND WASHHOUSES COMPETITION, GREENWICH.

Borough Council and the ratepayers of h generally have every reason to be with the result of their baths com- reckoned as a business proposition. ellent site in Trafalgar-road roughly s in rectangular form about 256 ft. ft., having the advantage of being open sides. The main frontage faces nearly ith Creed-place on the left and Park- the right. Thirty sets of drawings en on view during the week in the Town The majority are above the average in ugh perhaps not one design can rightly rited as being of outstanding merit, levational treatment into account as the contrivance of planning. Being of inion we appreciate the difficulties el to the assessor. Mr. H. V. Ashley own practical judgment, and in the of his choice we fully concur. The oints of not a few approximately equal ultimately to be adjudicated, had to pared very carefully, and even so the es remain, perhaps, only matters of e. Certainly, the selected design solves blem, presenting a well-considered plan cost has not escaped attention.

esign by Messrs. F. J. Horth and H. (Hull), which is placed first, has three trances with capital crush halls near el and would be readily cleared. he first and second-class swimming- r men have direct exits either into the west thoroughfares, furnished with orways to each exit hall—an important to split up the throng when concerts and public meetings are held in these bath halls. The women's bath is in the centre. Round about it are top-lit slipper baths. Each section of them is furnished with open areas to light and ventilate their respective waiting-rooms and water-closets. Six feet wide corridors give access and allow of secondary entrances. The first-class men's bath is 110 ft. long by 55 ft. wide; second ditto 90 ft. by 54 ft.; and the ladies' bath hall measures 75 ft. by 36 ft. The larger ones have clerestory windows, as well as lantern lights, plain and practical places, as they should be. In front of the premises the committee and refreshment rooms occur. There are four good exit stairs from the galleries with outgoes well apart from other traffic. Douche rooms and sanitary provisions are attached to their respective bath halls. A Russian bath is situate in the rear of the larger swimming-bath and faces Woodland-place. The entrance vestibule, off the main corridor, is along the end of a waiting-room opening into the vapour, shampoo and cooling apartments, all economically contrived and capable of enlargement. Ample storage space is ingeniously contrived in various parts of the premises. The boiler-house and establishment laundry stand at the back of the central bath with an open area and a yard off Creed-place. This ultimately can be used for an extension. The top corner of the site in Park-street is devoted to the washhouse with an ample entrance quite distinct, of course, from the baths. There is a nice room for children with closets *en suite*. The washing place and ironing room are separated from the vestibule by a waiting-hall well planned. The elevations of this design are simple and dignified in a modest manner. The manager's rooms are located on the first floor in the middle of the façade. The big baths are fronted by a pair of flanking pavilions treated with hipped roofs. The main portals have double doorways set within big semi-circular arches which adds a sense of scale. In the drawing, the chimney shaft looks over-assertive, but it is set at the back of the baths and will not really be seen from Trafalgar-road. The drawings leave nothing to be desired.

In all likelihood the referee shared our preference for the very refined architectural character of the design by Messrs. Horace Field and H. D. Pearson, FF.R.I.B.A., placed second. This design, with elevations conceived in a modified manner influenced by Christopher Wren's taste so famously represented by Greenwich Hospital, Mr. Ashley nevertheless placed second, perhaps with regret not to be free to further the materialisation of these façades. The crush halls assume too much the form of verandahs with three bay arcades opening into the forecourt in each case. As crush halls, so called, they are separated from their adjacent bath halls by a cross corridor, and in the event of the alternative use for entertainments these overflow passage-ways right and left might cause confusion. The introduction of doors for occasional use in corridors is, of course, undesirable.

The stairways to the galleries are not quite so efficient because their exits open into the connecting colonnade or cloister in front of the courtyard, thus concentrating the public needlessly in the central way leading from the court into Trafalgar-road. The women's bath is relegated to the back part of the site in the middle, the central frontage being recessed and screened with the colonnade of Doric coupled columns and surmounted by a balustrade set between the wings flanking the court. The

reenwich Baths Competition. Second Premiated Design, by Messrs. HORACE FIELD and H. DIGHTON PEARSON, FF.R.I.B.A

building along Trafalgar-road has a forecourt 28 ft. deep and areas also are allowed about 10 ft. deep to the side elevations. The men's slipper baths are placed in the first floor on three sides of the quad. Below them are arranged the refreshment rooms, cloak rooms, and offices. The establishment laundry is at the far end of men's first-class bath. The wash-house position corresponds with the selected plan and is equally well contrived, though the room for children is less important. Capital details to big scale are presented. The pediment towards Trafalgar-road makes a handsome central feature and this frontispiece is more monumental in strict accord with the end pavilions, designed throughout with brick and stone, after the manner of Sir Christopher Wren. The side elevations are admirable, broadly disposed and picturesque.

The lay-out of the scheme of Messrs. P. B. Mennie & L. D. Smith, Lincoln's-inn (placed third) is more like the first prize one and covers about the same area of buildings. The crush halls are not equal and the two long transverse corridors do not improve the working arrangements. The exit stairs for galleries in the big bath halls do not discharge direct into the streets, neither have these assembly rooms immediate exits provided in the selected plans. The slipper baths are contrived round the central position of the ladies' bath hall; the boiler house is at its rear. A cooling room for the Russian bath, which is situate at the back of the men's first-class bath, adjoins the steaming room furnished with gallery seats like a school class-room. There are three waiting rooms for the wash-house, approached by a narrow long passage with a poor entrance lobby. The wash-house itself is spacious. Roadways flank the boiler house at the back of the premises. The design has a cupola rising over an open-sided lantern of masonry placed above the women's crush hall and behind a pedimented portico. There are secondary pediments and pilastered pavilion fronts to the big side baths designed for execution in stone, rather tame in detail, but not badly proportioned or lacking in interest.

No. 4 in the list of designs is by Mr. Stephen Ayling, F.R.I.B.A., who allocates positions to his second-class swimming bath and women's bath in the flanks of the site, and places the first-class men's bath transversely at the rear, giving it a crush hall entered from Creed-place. His wash-house extends along Park-street and he puts the slipper baths along the Trafalgar-road frontage. This dwarfs the main elevation and the mass of the swimming bath rising behind on the left gives a lopsided appearance to the whole. The centre-piece has a loggia in front of both the men and women's entrance halls. The gallery exits fail to discharge into the open, so far as we could see, but we regard his design among the best submitted.

No. 14 shows many good arrangements arrived at by long experience, and the exteriors are appropriate. The placing of the slipper baths facing the main street in a "lower ground floor," under the regular one, is a variation not exactly suggested by the site. The design is submitted by Messrs. Alfred W. S. Cross and Kenneth Cross.

No. 22, sent in by Mr. W. Allison, A.R.I.B.A., locates the slipper baths on the first floor, ranging them in triple order. He introduces a mezzanine and makes much of his entrance pavilion.

No. 7, the scheme of Messrs. Boddy & Dempster, presents a monumental centre-piece fit for a palace with very plain wings. The purpose of the premises is not satisfactorily expressed by the exteriors.

No. 9 is similarly contrived by Mr. Geo. E. Williams. The crush room, 24 ft. square, leads to nowhere in particular, and the plan is too cut up. Messrs. Burgess & Church, in No. 12. put the first-class bath along the back and allow it a "foyer" all on its own. Generally, this plan is not economic. Mr. Thomas Spencer, A.R.I.B.A. (No. 25) is represented by ten sheets, including a plan showing the halls arranged for concerts. The largest one can only be cleared by traversing long corridors, and the crush rooms are too much inside the premises.

The exhibition closes at noon on Saturday.

CORRESPONDENCE.

Competitions.

Sir,—I feel very strongly in view of the unsatisfactory results of some recent competitions (in which I was not a competitor), that the jury system should be insisted on, and that ordinary pencil drawings should be considered sufficient for a competent jury. Architects do not seem to realise that without competitors there can be no competition.

Further, there is now an added horror. I recently sent for the conditions of the Coatbridge War Memorial Competition. This is for a memorial to cost £3,000, a lay-out in a public park and design for new entrance gates. The drawings have to be rendered, an inked-in perspective prepared, and the drawings mounted on strainers. The large sum of £75 as first premium is offered with no guarantee that the winner will be appointed to carry out the work. I returned the conditions at once, and was informed by the Town Clerk that my deposit would not be returned unless I sent in a design. I may point out that an F.R.I.B.A. is the Assessor.

When I wish to help lower the rates of the Parks Department of a little Scotch burgh I will do so voluntarily if I so desire, but object to forceful measures. This method is not in accordance with the etiquette of architectural competitions. Being a mere Southerner, I did not give up all hope, but immediately 'phoned my bank, as it occurred to me that the letter I received might have outstripped my cheque, which was the case, so I took the liberty of stopping the payment of the cheque. I suggest a "Golden Ballot" to the notice of the burghers of Coatbridge. I am desolated if the said gentlemen have to sing of the scarcity of the season's crop of guineas from the South.

Milkmaid Wager Cup.

(See Letter on this page.)

Milkmaid Cups.

Sir,—I was much interested in the illustra published in your issue of the 5th inst., of "Milkmaid Wager Cup" (1787), exhibite the Church Congress, recently held at Plym I have among my collection a somewhat sir cup, undated but evidently of the same type period, and enclose you herewith a photog of it. I should be greatly obliged if you w kindly inform me of the origin of the "Milkmaid Wager Cup." As you will see one in my possession is very delicately ch and both the inner portion of the dress an suspended cup are gilt inside, and I have wondering if such is the case in the one trated. My cup is about 8 in. high.

R. Stephen Aylin

London.

Alabaster Panels.

Sir,—In the "Records of the Borough Nottingham there are numerous entries w go to show that an extensive business carried on there in alabaster panels, as illust in your last issue in the fourteenth and fifte century. They were used as retables, embraced a variety of scriptural subjects. haps the most popular being the "St. Baptist heads." The names of about a d "alablastermen" are mentioned, and it s clear that the material was chiefly obta from the village of Chellaston in Derbyshir wrought in the workshops at Nottingham; further, that the Burgesses of Nottingham a prescriptive right to the trade, for in Nicholas Godeman, "not being a Burgess," displaying images for sale, "made fine licence to traffick, 8d."

It would be interesting to know how ma these panels are still extant.

Harry Gil

Nottingham.

Parallel or Tapered Baths

Sir,—Who is responsible for the pr ridiculous craze for parallel baths? Is absurd æsthetic affectation of the new sch architects, or is it the outcome of lazine the part of the draughtsman, or is there profit for manufacturers? For there w appear to be no practical advantage wha of the parallel over the taper bath. No adv of the parallel bath has been able to give m more convincing reason for the preference "It looks so nice in the bathroom." Its advantages are numerous and manifest. heavier and more costly and takes up room, which is a very important point in houses; it takes more water to supply a d bath, and most of that is only of advanta anyone with excessively large feet; and water means more fuel to heat it.

Let anyone run a small quantity of water a parallel bath and into a taper bath and how the side lines of the water surface comp in one case rapidly converging to the wrong in the other almost parallel. Moreove parallel bath is so clumsy an affair that former 2 ft. of width inside at the shoulder been reduced to 1 ft. 10½ in., at a considera loss of comfort, and this has given a disast precedent to the manufacturers for the re tion of the taper bath also to 1 ft. 10½ in that it is now difficult to obtain a bath rational type.

And the only excuse for suffering these advantages: "Oh! it looks so nice and h some in the bathroom." What rot! Why agitate for parallel coffins to spare the æsthetic undertaker the agony of having to a tapered coffin on the parallel shelf of a va It would be just as sensible.

If, however, any of your readers can forward a convincing reason for using par baths in preference to tapered I shall be delig to hear it, for it would save me much trou hunting up tapered baths of the old type fo clients.

Frank Gray Wall

Eastham, Cheshire.

Group on the Pediment of the Metropolitan Life Insurance Building, San Francisco.
Mr. Haig Patigian, Sculptor.

HAIG PATIGIAN:
AN ARCHITECTURAL SCULPTOR OF SAN FRANCISCO.

By KINETON PARKES.

A good deal of excellent painting, decoration, sculpture, and architecture has been designed and destroyed on behalf of the great exhibitions that have been held from time to time in Europe and America. A signal example was the Panama-Pacific International, of which the most noteworthy architectural feature was the fine modelling of Mr. Haig Patigian, the San Francisco sculptor.

This artist is an Armenian, born in 1876, whose self-education in the arts until he was forty years old was only modified by a period under Marquet in Paris. It was then he went to the United States, and at once began his career as a monumental and architectural sculptor with a memorial to McKinley. His composition, "Ancient History," after being shown at the *Salon des Artistes Français*, and to the Pennsylvania Academy in 1907, was a member *hors concours* of the International Jury of the Panama Exposition, and it was the extensive work he did for this that firmly established his reputation in America. In San Francisco he is well known and his work greatly appreciated.

"Genii of Machinery." Detail: "Blind Force."
Mr. Haig Patigian, Sculptor.

Patigian's work was on the Palace of Machinery, and he worked in collaboration with the architects Ward and Blohm. The main entrance was approached by four free Corinthian columns, each surmounted by a modelled figure 16 ft. high. These statues, representing Steam Power, Invention, Electricity, and Imagination, were all male nude figures with appropriate emblems. The entrance itself was in the form of a tall decorative arch, enclosing four more Corinthian columns supporting an entablature, on the cornice of which two spread eagles were placed. The bases of these columns were decorated by eight figures in bas-relief, the cylindrical contour being successfully retained. Wing *motifs* were largely used, the anatomical attachment of birds' wings and human arms being similar, and the massive wings in the conception of the Genii of Machinery are made to convey the idea of motive power, and decoratively the feather structure spreading backwards over the cylindrical surface and welding the design. The wing structure also served for a decorative background for the mechanical "Disciples," powerful male figures engaged in mechanical occupations. The figure "Blind Force," with sightless eyes, powerful torso, and its attendant pieces of machinery, explains itself All the figures, however engaged, were designed to give the idea of support to the massive columns, and were placed in relation to the whole architectural scheme of the entrance, and were about 7½ ft. in height.

The four columns framed two passages and thus formed a lobby. To the right and left the hallways were large, and prefaced by decorated arches with modelled spandrels of nude male figures engaged in mechanical operations, and these arches were repeated on the walls at the end of the passages. The whole structure of the entrance was massive and imposing, and the generous use of Patigian's sculpture was more than justified.

The Memorial Museum at San Francisco bears important permanent work by this sculptor, also used architecturally. The tympanum group over the entrance contains five figures: in the centre a draped female representing Life, holding the book of life, but also a skull, a reminder of Death, supported by two boys, "Hope" and "Aspiration," holding respectively a torch and a roll of parchment, while on either side are kneeling male figures, slightly draped, of a young man, "Industry," and an old one, "Wisdom and Knowledge."

Above this tympanum group is a huge moulding in the arch, which carries four winged female figures, each supported by a Moorish-Gothic bracket, of "Sculpture," "Architecture," "Painting," and "Music," very finely conceived and freely modelled.

Another piece of good modelling is the figure of the "Angel of Death," called "The Guardian," treated by the sculptor as a sexless being, whose mission is no more than that of bearing sorrow and supporting it. The figure forms the principal feature of the massive bronze door of the mausoleum of Miss Dolbur. of San Francisco. The hands bar the entrance to the tomb with a tender touch, and the lines of the wings and drapery are treated with severity and in a way to conform to the simple dignity of the Doric character of the architecture of the work.

The Metropolitan Life Insurance Building in San Francisco is a notable piece of modern architecture, and its wide, flat pediment contains Patigian's most ornamental work, partly floral in character. with reminiscences of the Italian manner. A central winged, half-draped female figure holds a coat of arms and a ball: on her left is a figure similarly treated of a woman and babe. and on her

"Architecture": Detail of Arch.
Mr. Haig Patigian, Sculptor.

right a nude female figure holds another child. Balancing the motherhood group is an old man with the scroll of life spread before him, from which he reads to a younger man listening attentively. Another nude male figure holds a cornucopia, with the flowers and fruits of the earth as symbols.

An "Allegory of Achievement" is a striking work of an architectural character in the form of a bronze shaft presented to Mr. Charles M. Schwab by the shipbuilders of the Pacific Coast in recognition of his services during the war. Its cylindrical base is simply treated, and is divided into four panels, bearing reliefs of "Progress," "Industry," "Commerce," and "Patriotism." This is surmounted by a simple sphere, supported by ships with Pegasus as figurehead, that sail the four quarters, the design held together by conventional waves. The figure of "Progress" holds a winged globe and the torch, and is that of a female, as is also "Commerce"; "Patriotism" and "Indust being men.

Other forms allied to architecture whicl artist projects are figures for fountains swimming-pools; and a "Nymph at Play a charming example of the latter. Patigi a member of the American Federation of and the National Sculpture Society, organisations which have greatly helped otherwise vigorous activity of architectu the United States.

Lobby of the Palace of Machinery, the Panama, Pacific and International Exposition, San Francisco. Spandrels and bas-reliefs at base of columns. By Mr. Haig Patigian, Sculptor.

THE DOME IN INDIA.

By V. B. METTA.

he dome was used in Indian architecture
re the birth of Buddha, which was twenty-
centuries ago. There are three stages in
evolution—the bamboo stage, the timber
e, and the brick and mortar or the stone
e. Examples of very ancient domes do
survive in the country, because they were
e of such perishable material as bamboo
mber, but examples of the third class of
e are to be found in the architecture and
pture of the Buddhist Period. The Indian
e is divided into three parts—the Griva,
he neck; the Sikhara, or the main body;
the Mahapadma (the eight-petalled
s, the symbol of God), or the crown.
Kalasha—that is, the water-pot, the
bol of the creative element—is placed over
lotus crown. If one looks at this dome
the inside it will be found that it is
e to represent an open lotus. The interior
ration of the dome is horizontal, and
efore it is much more varied than the
ical decoration, which one sees in Euro-
domes.

he Mahomedan conquest brought some
ideas into the country, but, at the same
e, it should be remembered that the
dus gave more to their conquerors than
received from them. The Islamic archi-
ure of India is really more Hindu than
acenic. The Mahomedan invaders very
ly brought architects with them, and so
had to employ Hindu designers and
kmen to build buildings for them. The
dings of the early Mahomedan period
etimes have conical-shaped domes, because
r builders unconsciously reproduced either
conical sikharas of their temples, or the
le of their domes, which look conical.
n came what Fergusson calls the
athan " dome—a radiating and not a
zontal type of dome, with a flattened top
strongly pronounced haunches.

ow, really speaking, there was nothing
athan " about this dome, because it was
l in the country long before the Mahome-
s came. According to Mr. Havell there
e two kinds of domes used in ancient
a—the ribbed dome and the horizontal
e. In the former kind of dome eight stone
resting upon the base formed the struc-
, and the space between these ribs was
l up with bricks or stone laid horizontally.
the purely horizontal type of dome the
ard thrust hardly existed, on account of
very nature of its construction, while in
ribbed type the eight-petalled lotus at the
was used to prevent the dome from
roying itself. The Buddhist domes, used
er decoratively or constructively in the
dhist stupas and caves, are of the ribbed
. These ribs were gradually reduced in
ber until they became merely ornamental
disappeared altogether. The Jain domes
be seen on the porches or the shrines
he temples on Mount Abu are the lineal
endants of the Buddhist domes. The
h domes are supported on pillars, ranging
eight to as many as fifty-six in number.
gusson was so struck with the beauty of
e porch domes that he wrote about them
ollows:—" The Hindus obtained singu-
varied outline in plan, producing the
iest results of light and shade with every
ge in the sun's position."

e praises this Jain arrangement of the
e and pillars used accidentally by Wren
St. Stephen's Church at Walbrook, but
: " It would have been greatly improved
its resemblance to a Hindu porch been
e complete." After the so-called
athan " dome appears the bulbous dome,
hich Mr. Havell holds the opinion that it
olved from the bent bamboo arch used in
gali huts.

he Hindu domes were small, and so the
thing which the Hindu builders had to
nder their Moslem rulers was to enlarge
size of their domes. This they succeeded in doing wonderfully well, as the results show. This was what they did: They built two domes—an outer and an inner one. Of these, the outer one was " false "—that is, it was merely a shell of concrete and plaster—while the inner dome was the real one. They also began to use pendentives, or corner brackets at the angles, whenever stone beams at the base of the dome required this kind of support. The Persians knew the use of these pendentives, but their pendentives were much lighter than those of the Hindus. The dome in India was now quite safe, because its lateral thrust was counteracted from the inside. Fergusson goes almost into raptures over the Hindu workmen's skill in constructing domes, and compares it with that of Europeans, very much to the disadvantage of the latter. He thinks that the European builders were most timid and unskilful in their work, because they had not been able to find out how to counteract the lateral thrust of the dome from the inside. They built external buttresses, and piled great masses of masonry on the haunches of the dome to prevent it from destroying itself. This was a clumsy device, as it spoiled the exterior appearance of the dome.

The Hindu influence both in the construction and decoration of almost all Mahomedan domes in India cannot be disputed. Their shapes are of Hindu origin, as already pointed out. Internally, also, they are constructed in such a way as to represent the omnipresent lotus of the Hindus. In the early days of Mahomedan rule the builders put only the Hindu metal finial on the domes. Later on they feebly carved the lotus leaves at the base and crown of the dome, and finally these lotus leaves were strongly marked. Let us look at the dome of the Taj Mahal to see how much Hindu influence there is in it. It is not Saracenic, because its curve is not a single unbroken one as in the purely Saracenic domes of the mosques and tombs of Cairo. It curves at the base, which the real Saracenic dome does not do. Its bulbous shape is also of Hindu origin.

It has the typical lotus leaves of the Hindu dome at the base as well. Its pinnacle does not rise abruptly from the crown, but is connected with the centre of the dome by the Mahapadma, the eight-petalled lotus. I may also mention that the great dome * on the tomb of Sultan Mohammed at Bijapur is also the product of Hindu architectural genius.

The Indian dome, like the rest of Indian civilisation, has influenced all neighbouring countries. The bell-shaped dome to be seen in some of the Buddhist stupas of India was adopted in Burma and Siam along with Buddhism. M. Saladin points out that the dome of the tomb of Tamerlane at Samarcand is of Hindu type, because it was built by Indian workmen whom the conqueror had taken with him there. Finally, it has been noticed that the domes of some of the mosques in Persia and Mesopotamia have as finials not the Crescent of Islam, but the Chakra, the Buddhist Wheel of the Law, which is to be found in the Buddhist art of India.

* It is larger than that of the Pantheon at Rome, as Fergusson points out.

EXHIBITION NOTES.

AUSTRALIAN ART.

The Exhibition of Australian Art at the Royal Academy will be welcome to many even if it contains little that can be called distinguished. It may be objected that it is not up to the latest date in glaring departures from the well-worn paths, and that there is too placid an air about it all. But we may surely hope that artists who can paint so well will some day throw off the well-worn clothes and essay a more arresting dress. Still, we have in this exhibition a high average of sound work, and many fine expressions of Australian scenery with its vast distances and striking features. Over two hundred exhibits are very well displayed in the five galleries allotted them.

THE GIEVES GALLERY.

Stimulating and delightful are the vivid paintings of the mountains of Switzerland by Prof. H. B. Wieland at the Gieves Gallery. These pictures bear the impress of direct and sympathetic vision. Some of them have a rugged force which illustrates the tremendous natural upheaval which originated the scenes, but others have a quiet breadth and beauty of singular charm like Nos. 13, 18 or 30. The professor's energy is perhaps over-much emphasised in his work, but the pictures are welcome and stimulating.

THE ARLINGTON GALLERY.

If the public bought pictures on their merits one would expect to see several of those in the Campden Hill Club Exhibition at the Arlington Gallery starred before the closing days. To be able to buy such excellent water colours as Nos. 36, 10, or 41 at the prices marked is surely a chance for those whose love for art is not to be measured by the price affixed to it. We shall look with pleasure for the next exhibition of this Club after the memory of sincere and pleasing work by M. F. Montmorency, S. Blunt, S. M. Fisher, A. M. Burton and others. The collection was not free of eccentricities, and one may perhaps be forgiven a sadness over " The Birth of Eve."

DEVON ARCHITECTURAL SOCIETY.

EXHIBITION OF DRAWINGS.

An exhibition of the current year's prize drawings in connection with the Royal Institute of British Architects, organised by Mr. J. L. Fouracre, chairman of the committee of the Plymouth branch of the Devon and Exeter Architectural Society, was opened by the Mayor of Plymouth at the Public Library at Plymouth, on Tuesday last week. Mr. Fouracre, who presided, remarked that though the exhibition was not perhaps so attractive as a show of oil paintings and water colour drawings, the exhibits were beautiful and very skilful scientific documents, some executed with the object of showing from the bed rock how very fine buildings were evolved. The students who had gained the prizes were young men who would be the great architects of the future, and if the exhibition had the effect of inducing some of the younger generation of architects to compete in future competitions it would not have been held in vain.

The Mayor congratulated the chairman and committee of the Plymouth branch of the Architectural Society on the work they were doing, and expressed the hope that a study of the beautiful architectural drawings and designs on view would encourage young men to take full advantage of the educational system, and then, perhaps, one day a young man from one of the Plymouth schools or offices might be among the leading architects of the country. When they regarded the wonderful buildings of Inigo Jones and Wren it was difficult to realise that they existed in the minds of those great architects before the foundation stone was placed in position. Commenting upon some of the important buildings recently erected in London, the Mayor alluded to Messrs. Selfridge's premises in Oxford-street as a thing of beauty and commercial practicability combined. He emphasised the importance of great care being taken in the designing of factories, so that they might be bright, cheerful, and convenient for the people who worked in them and make their lives happier. He expressed a fear that the character of the buildings erected during the present time would suffer to some extent through lack of money.

Mr. Frederick Shelly, in thanking the Mayor, alluded to the flourishing condition of the architectural students' classes in Plymouth, and the great benefit which students derived from travelling and inspecting the fine buildings on the Continent.

Messrs. Holt's New Offices, Liverpool.

We give this week the winning design in the limited competition for the Holt Shipping Co.'s offices by Mr. Arnold Thornely, F.R.I.B.A., and Mr. Herbert J. Rowse, A.R.I.B.A. In the *Liverpool Post* of Wednesday is a descriptive article on the design from which we take the following:—

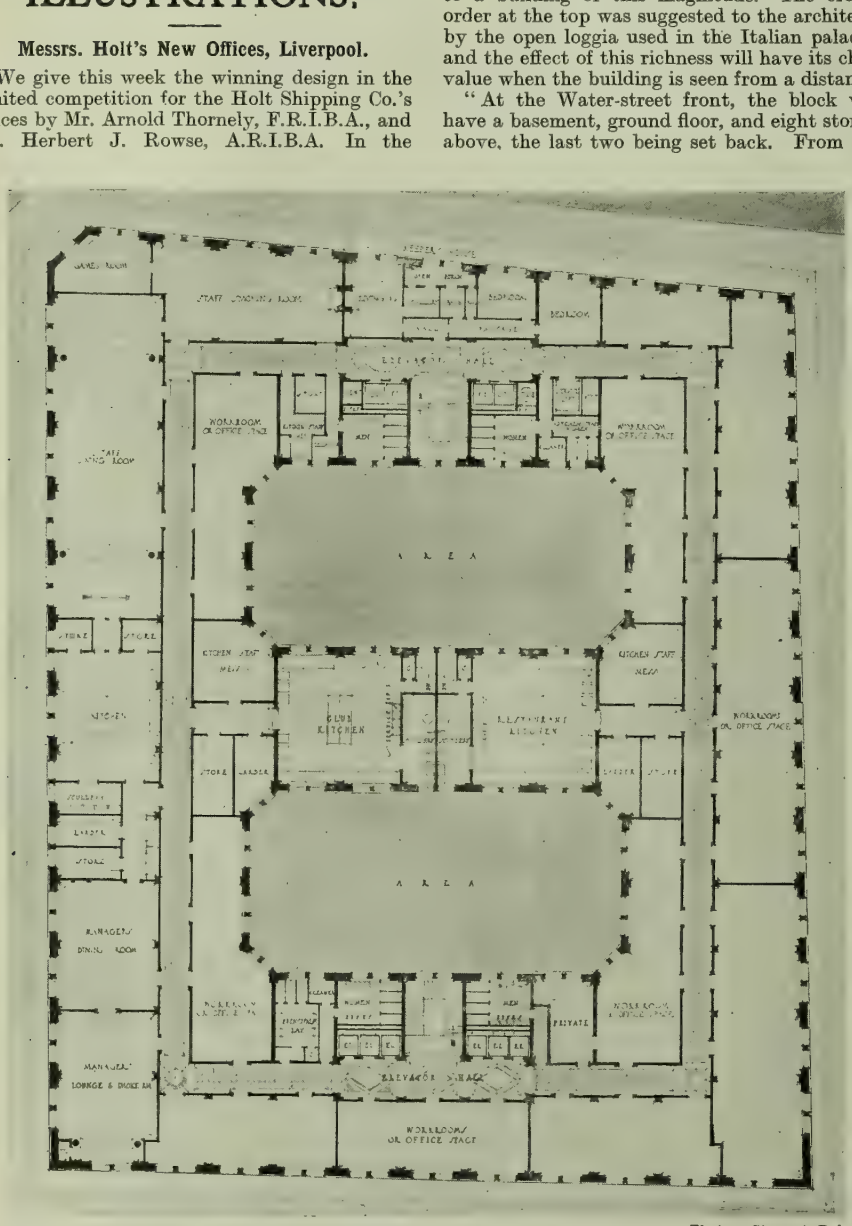
"Costing about a million sterling, the building is to be erected on the 'island' site, bounded by Water-street, Brunswick-street, Fenwick-street, and Drury-lane, with an approximate frontage of 220 ft. to Water-street, and of 257 ft. to Fenwick-street. Along the Water-street frontage of the building the thoroughfare will gain in width to the extent of 18 ft., and Fenwick-street and Drury-lane also will be widened, thus gaining very much in importance with regard to traffic, while affording the new block a much improved setting.

"Problems of lighting in respect of surrounding buildings were involved, and in order to solve these the architects propose the double set-back of the two top stories. They have dealt with these after the style of the big New York buildings, which come within the operations of the 'zoning law.'

"The building will be of Portland stone, and the lower stories, which come within the view of passers-by, are to be richly treated, while the space between these and the order crowning the building will be treated simply in refined ashlar, the reason being that a scheme of ornamentation from top to bottom would be wholly unsuited to a building of this magnitude. The crown order at the top was suggested to the architects by the open loggia used in the Italian palaces, and the effect of this richness will have its chief value when the building is seen from a distance.

"At the Water-street front, the block will have a basement, ground floor, and eight stories above, the last two being set back. From the ground to the main cornice the height wil 120 ft. and to the top of the set-back sto approximately 150 ft. Owing to the eleva of this part of the city the building will st higher than the Liver Building, though not i a loftier erection, and it will be a landmark f the river.

"As to the plan of the building, one of great features of the ground floor will be a banking hall occupying that half bounded Water-street, Fenwick-street, and Brunsw street, the main public space being about 13 long, with very richly coffered ceiling, and te nated at either end by two octagonal halls. complete vista of the whole length of the will be obtained by the public.



"Another feature, of importance to ten and others using the building, will be the elevator halls situated on the Water-street Brunswick-street sides. These halls will be fa in Roman travatine marble, a very plea cream colour, and will be crowned with t saucer domes, also in travatine marble enriched with coffering. Six fast elevators to be placed in the main hall near Water-str and four near Brunswick-street, and there wi spacious lavatory accommodation grouped r the elevators on each of the main office floor

"Each of the typical office floors will h a continuous circulating traffic corridor. vision has been made for an important clu the seventh floor, the apartments for wh should form one of the finest suites in Engl Entrance to this club will be obtained from t Brunswick-street and Water-street, and on its features is to be a fine dining-room 8 long; it will also have a billiard-room, c reading, and writing rooms, and a gallery lou

In the same issue of our contemporary is article by Professor C. H. Reilly, who says

"Those who know New York will be fami with the great rectangular blocks of build that are rising in the upper portion of Fi avenue and in Park-avenue. They will kn their clear surfaces and clean-cut lines, t even distribution of windows and freedom fr all excrescences, such as domes, turrets, or o windows. They are buildings which rely their effect on the impressiveness of their ma with which nothing is allowed to interfere. S ornament as they have is delicate surface or ment with no great columns or pediments give the pretence of palatialness. They achi grandeur rather than assume it as a garme Such a building is the new Holt Building. one looks at the great office blocks of Liverp since the Dock Board building, which belo to a previous era, one sees how the same ide have gradually grown here. The West Afri Bank, the Cunard Building, the Adelphi Ho are all buildings of simple rectangular sh relying for effect not on an array of columns other trappings, but on the fine articulation the strength their mass gives them. S buildings can, of course, only come about on rectangular sites, and it is one of the hope signs for our town that for economic reasons development of building sites tends in t direction.

"One may say that with the Holt Build the American orientation of Liverpool archit tural thought reaches its climax. The build Messrs. Thornely and Rowse have design would not disgrace Fifth-avenue; indeed, would sit there very happily, and those w know most of modern architecture will kn this is very high praise. No one must th from this comparison that the new Holt Build will be a tall building or skyscraper in American sense. The best American buildi are not, nor is this. From the published ill trations it will be seen that it has a very ratio and normal relation of height to width and ma It is lofty—120 ft. to the main cornice—beca it is big, but not unduly so."

THE BUILDING ART: THEORIES AND DISCUSSIONS.—X.

By W. R. LETHABY.

LATER BUILDING MASTERS AT WESTMINSTER ABBEY.

(*Concluded from last week.*)

Now I turn back from the building to a fuller account of the building masters. In 1360 Henry Yevele had succeeded Thomas of Gloucester as King's mason. In the Patent Roll for that year is entered the "appointment of Henry de Yevele to be disposer of the King's works pertaining to the art of masonry in the Palace of Westminster and the Tower of London, taking in the office 12d. a day." He was also directed to take (press) masons for the works and put them on the King's wages, and to commit to prison all contrariants. In accounts of 1365, when the old clock tower of the Palace (the prototype of the present clock tower) was erected he is called director of the work at the Palace.*

Again in 1366 Yevele appears as master-mason of the King's works, with William Winchester acting as *apparitor*, or second in command; Master William Herland being master of carpenter's work and Hugh Herland his *apparitor*. This Hugh, thirty years later, was to be the great architect of that supreme work of carpentry the roof of Westminster Hall. He was doubtless the son of Master William, and born to timber traditions. (For Master Hugh, see Sir F. Baines' "Westminster Hall," Report, 1914, and "Westminster Abbey and the Kings' Craftsmen," 1906.)

In 1368 Yevele was one of the Keepers of the Works of London Bridge; and in 1383 he was repairing Rochester Bridge. A grant was made in 1369 "to Henry de Yevele, that whereas by Patent 34 E. III the King appointed him disposer of Masonry in the Palace of Westminster and the Tower with 12d. a day, he shall take the 12d. a day for life as well as a winter robe yearly at the Great Wardrobe, of the suit of esquires of the Household, or the allowance in place of it." In 1370 he and Master William de Wynford were each ordered to press 50 hewers of stone for the King's service. Wynford was to be the architect of the nave of Winchester Cathedral and the College. In 1371 Yevele contracted for beginning to build the London Charterhouse. "Lord de Manny and the Prior made an agreement with Henry Yevele for building the first cell and beginning the great cloister of the fabric for which the said Lord gave 600£ and laid the foundation" (Gerald Davies' "Charterhouse")

A mandate was addressed in 1374 "To the Keepers of the Port of le Pole (Poole) by mainprise of Master Henry Yevele, Masoun, and Jordan de Bartone (a Simon de Bartone was one of the masons at the meeting in 1356), citizens of London, to de-arrest the ship *Margarete*, of Wareham, of 48 tons burden, and two high tombs of marble for the Earl of Arundel and Eleanor, his late wife, one great stone for the Bishop of Winchester, and other things of theirs. To be taken to the port of London and there unloaded" (Patent). These marble tombs in a ship at Poole were doubtless from Purbeck, and possibly they still exist. At Arundel there is a tomb of an Earl who died in 1406, and his Countess.

Master Henry Yevele was himself tenant, in 1376, "of the Manor of Langetone, in Purbike," or rather of two parts of it, at first at a rent of £8 6s. 8d., and afterwards on still more advantageous terms (Patent). In this same year the rebuilding of the nave of Westminster Abbey was begun.

In 1385 an order was issued by Richard II to pay Henry Yevele 12d. a day, and confirming the patent of 43 Edward III appointing him director (*dispositorem*) of the works of the craft of masonry with 12d. a day for life (Patent). This grant was surrendered in 1390 because he was then granted the Manors of Tremworth and Vannes in the county of Kent (Patent). Our mason was evidently become a person of much "consequence." He had now reached old age, and in this year he was granted exemption from juries, &c., in consideration of his being King's mason and surveyor of works at Westminster Palace, the Tower, and Canterbury Castle, and on account of his great age (Patent). We may suppose that he was born about 1320.

Richard II, in 1394, appointed John Godmerstone, clerk, to make provision for the repair of Westminster Hall. The next year Richard Washbourne and John Swalwe (Swallow, so spelt by Chaucer), masons, were engaged to heighten the walls of the old hall 2 ft. with Reigate and *Pierre de Marre* (Marr, Yorks) according to the purport of a *fourme e molde* made by counsel of Master Henry Yevele, and delivered to them by Watkin Waldon, his warden, with twenty-six corbels carved according to a pattern, all the materials being supplied, except the instruments used by the masons in their art.

The accounts for remodelling the hall mention Master Hugh Herland, carpenter to the King, also Robert Grasington, William Canon, and others, carving angels, &c., in wood. Even in 1383 the great carpenter was said to be verging on old age, and in 1394 N. Wilton was made master-carpenter and engineer of the King's works for the art of carpentry throughout the realm. This may have been to relieve Master Hugh. The accounts of work at the great hall are guaranteed "by the sight and testimony of Master Hugh Herland, the King's capital carpenter and controller of the works, who received 12d. a day. Thomas Wolvery, whose tomb is at St. Albans, did the masonry work of the south gable with the window.

Richard II was deposed in the autumn of 1399 and his superb hall was hurriedly prepared for the coronation of Henry IV on October 13, 1399. William Burgh, glazier, was employed filling the great window with "flourished glass"; William Chuddere executed four images, probably those for the pinnacle; and a Thomas of Gloucester did the painting, including the making and painting the stage at the south end for the coronation. John Chaundeller supplied candles for the carpenters, who, we may suppose, had to work overtime (*Accounts* 473, 11 and 13). Both Master Hugh Herland and Yevele, the mason, must now have been very old; it was the end of an era as well as of a century. Chaucer, who had been clerk of works to the King's palaces, would have known them well, and the Carpenters of the "Canterbury Tales" may suggest what the status of a well-to-do carpenter was at this time. I cannot find when Master Hugh died; but his father's will was proved in 1375. He had lived in the parish of Paul's Wharf, and Hugh probably also lived in the City. Henry Yevele died in 1400. His will was dated May 25 in that year and enrolled on October 28. In it he called himself "masoun" citizen and freeman of the City of London and parishioner of St. Magnus at London Bridge. He directed that he should be buried in the said church, in St. Mary's Chapel, where his tomb is already prepared. He left considerable property; Katherine, his wife, was to enjoy a life interest in certain tenements charged with the maintenance of two chantries. Under certain circumstances the property was to be devoted to the use of London Bridge for two chantry priests in the chapel upon the same. He also left property at Alvythele and elsewhere in Essex. Stowe saw the tomb in St. Magnus, and says it was that of "Henry Yevele, Freemason to Edward III, Richard II, and Henry IV," who deceased in 1400." Apparently inscription must have been to that effect. reference to London Bridge chapel, take connection with the fact that he had been ke of the works of the bridge, suggests tha may have been the architect of the chapel w was destroyed just a century since. On refe to illustrations I find that it was very like cloister at Westminster, which was being just at the time the master was keeper at bridge. The drawings of Cooke at the Guil may be consulted on this.

Our mason's bequest to the Chapel o Mary at St. Magnus, where his tomb was, be traced further in an account of the en ments of London Bridge, to which this had transferred. Among "the properties form belonging to the fraternity called *Le Sal* the Church of St. Magnus" was a "tene held by Henry Yevele, mason, paying 5s., sit between the King's road on the east and Oyster gate on the west." Stowe give account of the Guild or Fraternity of *Le Regina*: "The better sort of the Parish t honour of God and his glorious Mother ca to be made a chantry to sing an anthe our Lady called *Salve Regina* every eve and ordained five burning wax lights at time of the said anthem in reverence fo five principal joys of our Lady and exciting the people to devotion" ("Chron of London Bridge.") The house referre which must have been close under St. Ma was probably Yevele's own residence, an may think of our mason stepping int church to join in the anthem before the with its five twinkling candles. (I suggest the story of Yevele, including his meeting the King he served, with Chaucer and, doub with Wycliffe, and in its setting of plague, adventure and art, might make a good su for a little pageant-drama.)

Another point that arises in interpretin will is, Did not Alvythele, Essex (now Av near Purfleet), give Yevele his name? I index of the Patent Rolls it is equated Yeovil. In the D. N. B. Yeaveley in D shire is suggested, and it is said that there also a manor of Yevele in Surrey (?). But not the Essex place, where the master property, and his own name have both pronounced Yaveley? †

At the Abbey Yevele was followed by Wi Colchester, who is called chief mason in account for 1–2 Henry IV. He received the year, with dress and furs. He is menti again in 1413 and 1416. The Guildha London, which seems to have been b within a dozen years of Yevele's death, much like his strong, bare manner of bui that it must belong to his school. It may been designed by Colchester. In or before John Thirsk took the place of Colchester, a is mentioned again in 1433 and about 14 the mason of Henry the Fifth's Chapel. Smith is named in 1452 and John Readi 1460. He in turn was followed by R Stowell in 1471, and in 1488–9 he vaulted s bays of the nave. Thomas Redman succe in 1505, and he was followed by his br Henry in 1516.‡ Then John Molton William Taylor were joint masters from (Rackham). These, I suppose, were respo for Islip's Chapel. Henry Redman was master-mason at St. Margaret's, the build which was begun in 1491; the steeple and were begun *c.* 1515, and were dedicated in (Bishop Hensley Henson.) The entrance remains a pretty and authentic piece of Henry Redman was buried in Brentfor Lawrence's Church, where he was comm rated by a brass on the west wall. I

* In this year he supplied 7,000 Flande (bricks) (Britton & Brailey). The name shov the modern brick came to us from Flanders. were used for chimneys and paving. He also s stone for the repair of Rochester Castle.

BOOK REVIEW.

West Middlesex Joint Town-Planning Committee: Preliminary Report upon the Regional Survey. By THOMAS ADAMS and LONGSTRETH THOMPSON. (London: 121, Victoria-street, S.W.1.) Price 5s. net.

The West Middlesex Joint Town-Planning Committee was formed in October, 1921, to prepare a plan, and to indicate the main outlines of development in the region which is bounded by and includes Perivale, Northolt, Northwood, and Harefield on the north; Yiewsley, Staines, and Shepperton on the west; Sunbury, Hounslow, and Chiswick on the south; and Barnes and Acton on the east. This preliminary report contains a survey of existing conditions necessary to the preparation of a 6 in. outline plan to show the main transport routes, provisions as to zoning, density, and open spaces, and to include proposals for the situation of civic and shopping centres, and suggestions, if required, for combined drainage. No less than eighteen local authorities are included in this area, which virtually comprises the whole of the western suburbs of London north of the Thames.

The region has from the earliest times been regarded as one of the chief market gardens of London, and it is rather astonishing to find that, in spite of being bisected by the Great Western main line, the area is still mostly agricultural in character. It is suggested that this character should to some extent be retained permanently by reserving a wedge of highly productive land beyond Hounslow for intensive vegetable culture. This, besides being of value as an easily available source of market produce, would help to obviate future overcrowding, but it should, of course, be supplementary to the provision of extensive public open spaces, which at present are quite inadequate.

The larger industries of the area are mainly situated on the Great Western line, and questionnaires were sent to 240 manufacturers. It is disappointing to note that of this number only 81, representing less than 34 per cent., took the trouble to reply, although the required information was supplied by all the larger firms. Probably the only way to elicit information from the smaller manufacturers would be by means of personal visits, when the object of the questions could be explained, and when it would be less trouble for the manufacturer to answer the questions than to turn his visitor away unsatisfied.

The Report includes plans showing existing conditions, the principal lines of communication, railway fare and time zones, and suburban passenger traffic. The recommendations include of course what we may call the usual suggestions as to zoning, density, preservation of amenities, and the fixing of building lines, and among the principal conclusions arrived at in respect to this particular region are: That the shortage of housing accommodation constitutes a serious handicap to its industrial development; that north to south connections both by road and rail are at present defective; that market gardening facilities should be improved, and that areas of productive parks should be reserved; that the Brent Valley and other natural features, including the low lying river land, should be preserved.

Of all the regions surrounding the metropolis West Middlesex is probably the most important. It not only contains a large area of the Thames Valley and the main line to Reading, but it is free from such "obstructions" as the Hackney Marshes, the Thames Estuary, Epping Forest and Richmond Park; and is thus more liable to be developed on short-sighted and injurious lines, if the matter of planning is not dealt with in a comprehensive and generous manner. It is gratifying to note that the problem is receiving such close and capable consideration, and we shall look forward with interest to seeing the plan to the production of which this report is a necessary preliminary.

MARY SLESSOR MEMORIAL WINDOW, DUNDEE.

THE designer of the Mary Slessor Memorial Window (illustrated on p. 574) has based his design upon her life as given by Mr. P. W. Livingstone in his book, "Mary Slessor of Calabar," and has endeavoured by the arrangement of the design to give as many incidental pictures as possible of this remarkable woman's life.

Of the two principal subjects the left-hand one illustrates her at work in the mill, whilst the right-hand one illustrates the outstanding feature of her missionary work, that of saving the children, and demonstrates her love and affection for them.

In the four smaller subjects below are shown incidents of her life as a missionary at Okoyong. From left to right:—(1) She is shown daring a horde of savage warriors to advance beyond her; (2) the chief Edem is seen kneeling at her feet thanking her; (3) on the fifteenth anniversary of her settlement she held her first communion service in the mission hall at Ekenge; (4) surrounded by native chiefs she is here shown as the acknowledged representative of the British Government acting as permanent Vice-President in the native court at Ikotobong.

The sixteen small pictures which form the border to the window illustrate in sequence outstanding incidents in her life, from girlhood to the last house she built and lived in at Odoro Ikpe, and the intention has been to show in these the gradual transition from the grey skies and colourless life of her girlhood to the gayer and brighter atmosphere of her African home.

Woven in among the ornament and to add a further interest to the window, and emblematic of her life's work and faith, there have been introduced in the centre of the left-hand light the pelican succouring her young with the blood of her own breast, whilst balancing this in the right-hand light is the Cross of Faith, surrounded by the Crown of Thorns, symbolic of earthly suffering. In the upper part of the left-hand light is a group representing Love or Charity over the text "Love suffereth long and is kind." In the right-hand light, seated upon the emerald rainbow of promise, is the figure of the risen Christ with arms raised in the attitude of blessing, while on the scroll beneath, "Between the Sower and the Reaper stands the Husbandman."

Inserted in the tracery piece at the top of the window is the Burning Bush and the Dove—as the Messenger in allusion to the Home Church and Foreign Mission of the United Free Church of Scotland, to which Mary Slessor was attached. In the centre of the base of the left-hand light is a map showing the field of Miss Slessor's activities at Calabar. Balancing this in the right-hand light is the Cross of the Order of the Hospital of St. John of Jerusalem presented to her by King George V.

As the sill of the window is only 4 ft. 6 in. from the floor, a great amount of detail could be used, since the whole of the window would be within easy focus of the eye. Further, as the other windows in the building would most likely not be filled with coloured glass, a considerable amount of face light exists, and to obtain the best result under this condition a good proportion of white or light-admitting glass has been used.

The window has been designed by Mr. William Aikman, of 7, Camden-square, N.W.7, and is to be unveiled this month.

Board of Architectural Education.

The centres for the R.I.B.A. Intermediate Examination, November, 1923, will be London and Leeds. At both centres the examination will be held from November 23 to 27, 1923, inclusive. At the London centre the oral examination will be held on November 29; at the Leeds centre on November 28.

Mary Slessor Memorial Window, Albert Instituté, Dundee.

Designed by Mr. William Aikman. (*See p.* 573.)

THE TOWN-PLANNING INSTITUTE.

ANNUAL CONFERENCE, YORK.

selection of York as the centre for this annual conference by the Town-Planning Institute was, no doubt, made in consequence of the policy of propaganda which is one of the objects of the Institute. From this point of view the selection seems a wise one. The first session of the conference (which was opened on Friday last by Mr. T. Mawson, President of the Institute) was held in the Council hall of the City Museum. In the absence of the Lord Mayor, a civic welcome was extended to the meeting by the Sheriff (Councillor J. E. Gibbs).

Acknowledging the Sheriff's welcome, the PRESIDENT said the Town-Planning Institute was one of the most vigorous of the younger professional societies. They might fairly congratulate themselves on the selection of York as the rendezvous for the conference, for York was a beautiful city, rich with architectural traditions, with a glorious history of intellectual and physical achievements, which were largely written in the wonderful Cathedral and many other buildings in the city. They, as town-planners, went to York for inspiration in their beautiful art and profession. They wanted to know how succeeding generations solved the problems with which they were confronted, and how the citizens now proposed to adapt their historic city to the needs of to-day.

The preliminary speeches papers were read by Mr. Benson, Mr. Spurr, and Mr.

The Evolution of York.

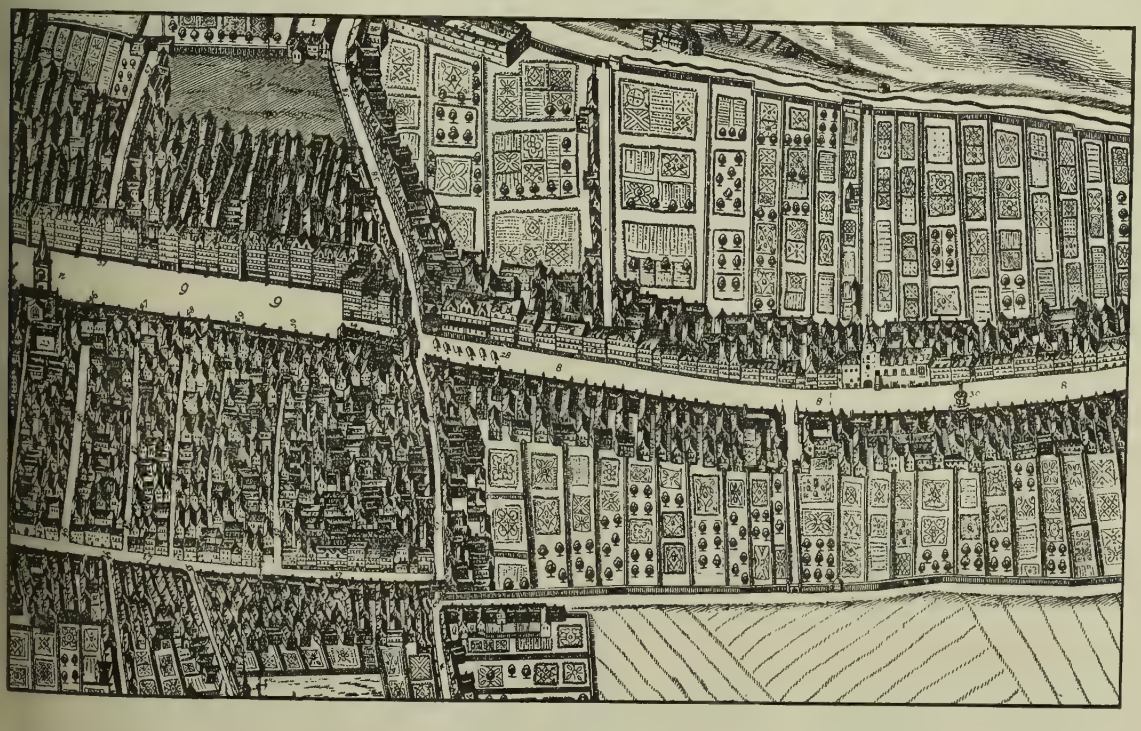
In the course of a paper on "The Evolution of York," Mr. GEORGE BENSON dealt with his subject under the following headings: (1) The Natural Factor; (2) Geographical Position; (3) Early Settlers; (4) Military Value; (5) Political Importance of York; (6) Ecclesiastical Metropolis; (7) York as a Fortress; (8) York as a Port and Commercial Centre; (9) York as a Coaching and Railway Centre; and (10) The Streets and Buildings of York.

Under the last-named heading, he said the commercial value of York was responsible for three of its greatest building eras, namely, that of the Roman Fort, the Norman Castles, and the Plantagenet embattled walls. The lay-out of the city from time to time had been influenced by its enclosing wall. The Roman Fort was rectangular, and its angles faced the cardinal points. Its streets were planned on rectilinear lines.

Subsequently the Anglians dwelt securely between the two rivers with the Roman Fort at their back. A winding trackway emerged through that suburb and crossed the Ouse south of the destroyed Roman bridge and climbed the Bishop's hill to join the old Roman road to Tadcaster at what was now Micklegate Bar. The other road from Aldborough to the Fort was continued, and crossed the new trackway and continued to the Fort. Those two were the main roads to-day. Under the Danes there arose new streets or gates winding in all directions. The Cathedral blocked the old Roman street passing through the Fort. The S.E. wall had been gradually removed and a new street arose within the line of wall from Feasegate, and cut through the N.E. wall, south of the Roman gateway, which was abandoned for the new one at Monkgate. The winding streets were also adopted by the Normans in their rebuilding of the city after the fire, and were continued to the Victorian era, when the Roman practice of rectilinear streets was revived.

The twelfth century was remarkable for the building of churches; no fewer than 26 new ones were erected, and six new chapels built. The suburb of Walngate was protected by a mound.

During the reign of Henry III a stone keep was built, and the Castle area walled in. The Minster transepts were erected and two-storied chapels attached to the Archbishop's palaces at York and Bishopthorpe. Bedem College, the four friaries, and the Gilbertine Priory were also erected.



York in its main outlines was to-day still a typical Edwardian city. Its walls and gatehouses, the Minster nave and chapter house, and the Abbey Church belonged to that period. The city was intersected by narrow thoroughfares from off which were numerous courts and passages. Nearly all the street corners were terminated by a parish church with its burial ground.

In the days of Queen Anne and the Georges York was a local metropolis. The country squires built themselves town-houses and wintered there.

During the Victorian era, streets of houses to accommodate workmen engaged on the railway arose in the Clementhorpe, Nunnery-lane, South Bank, Holgate, Leenan-road, Bootham, Layerthorpe, and Groves districts. Around the cocoa works new streets had arisen, and a model village at New Earswick. Since the war the Corporation had undertaken a housing scheme on the Tang Hall estate.

York was particularly well off in open spaces. Scarcroft, Knavesmire, and Hob Moor had been transferred by the Freemen of Micklegate Ward to the Corporation. Amongst other open spaces were Bootham, Monk and Walngate Strays, which were still retained by the Freemen. The Strays occupied 778 acres. There were fine riverside walks. Rowntree's Park of 17 acres was situated between Terry-avenue and Bishopthorpe-road, and had been recently given to the city. The Corporation had provided allotment gardens, tennis courts, bowling greens, golf courses, and band stands. All these required to be included in any planned scheme of reconstruction for York.

The citizens were proud of their historic monuments, and in any future replanning of the city they should be preserved and have appropriate settings, as had just been done in the case of the Merchants' Hall. There was the danger of heavy traffic, carried along roads adjoining some of our monuments; vibration was set up, resulting in cracks and injury to the stability of edifices. Along the greater part of the south side of the enormous and magnificent pile of York Minster there was such a road. Another example was that of the church of All Saints, with its beautiful octagonal lantern. On each side of that church was a road leading to the market, and along which heavy traffic passed, while, to make matters worse, the two roads were at different levels, and an up-and-down motion was caused. No wonder there were cracks in the edifice. Those who were responsible for the upkeep of the historic monuments were constantly expending money in repairing

Part of Gordon of Rothemay's Bird's-Eye View of Edinburgh.

them. Such streets should only be used for light traffic. These problems must be solved if the monuments which are an integral part of the city are to be retained.

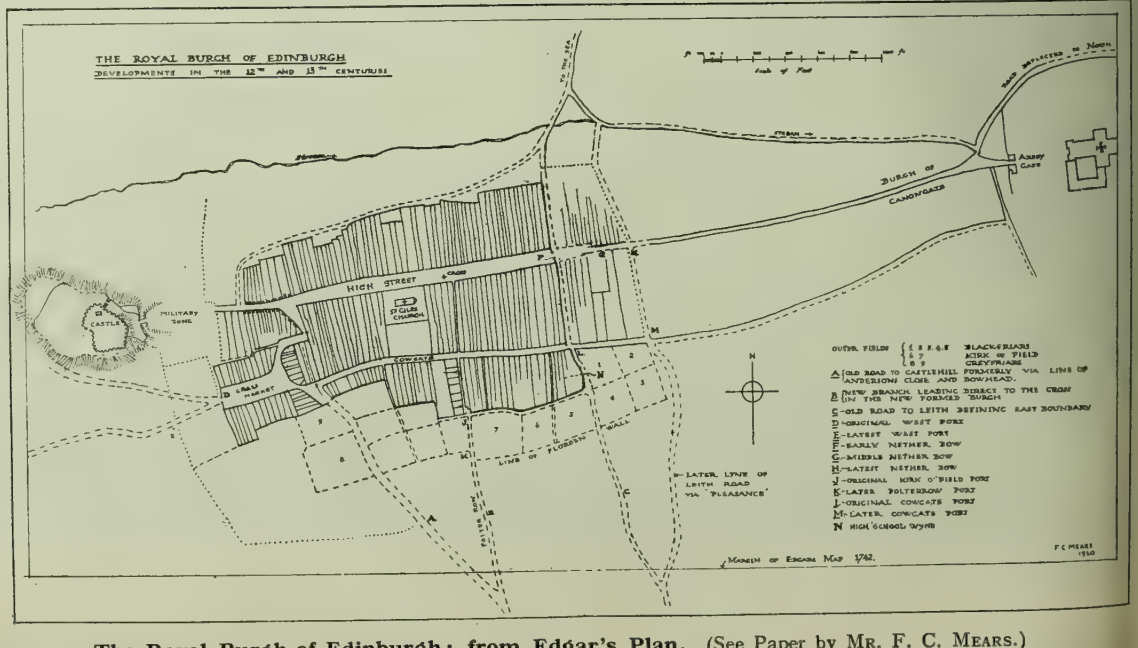
Town-Planning Proposals for York.

Mr. F. W. Spurr, in the course of a paper entitled "Town-Planning Proposals for York," said the York Corporation decided in 1913 to proceed with the town-planning of the areas to the north-east of the city, most of which were outside the city boundary, and within the district of the Flaxton Rural District Council. That authority was approached with a view to those areas being worked together, and representatives of the Flaxton Rural District Council sat on the Town-Planning Committee of the York Corporation, the Corporation in the first instance bearing the cost of preparing the scheme, the Rural District Council being the responsible authority for its own area after completion.

In 1914 the late Dr. Tempest Anderson suggested that competitive schemes might be obtained, and offered a first prize of £100. The Joint Committee and the Council agreed to this offer, and the York City Council also decided to provide two other premiums of £70 and £50 respectively for second and third designs.

The plan accepted (by Mr. Reginald Dann) was full of detail, which was not required to be shown to-day in connection with town-planning, and other plans would therefore have to be prepared to comply with the present requirements of the Ministry of Health. About the time the designs were obtained there was a great deal of misunderstanding, particularly amongst property owners, as to what were really the intentions of the Corporation, and with the object of giving full information it was decided to reproduce the first premiated design on a small scale, and issue a copy to each property-owner interested, and he thought they were successful in that respect.

Town-Planning Area No. 1 had a total area of 1,806 acres, of which 1,177 were in the area of the Flaxton Rural District Council, 456 in the city, and 173 in the area of the Escrick District Council. Area No. 2 had a total acreage of 543; 423 being in the Flaxton area and 120 in the city. Area No. 3 had a total acreage of 515; 506 in the Flaxton area and 9 in the city. Developments that were taking place in these areas were being arranged so as not to interfere with the proposed scheme. That was being done without any difficulty up to the present.



(See Paper by Mr. F. C. Mears.)

In 1920 it was decided to proceed with Area No. 4, and that scheme had proceeded as far as the first public inquiry, which was held in February last, when certain objections and proposals brought by property owners were put forward. The outstanding objections, however, had not yet been satisfactorily settled. The acreage of Area No. 4 was 109, situated wholly in the city. That area was taken in hand with the view of finishing off in the best way possible a large building area which had been left with a lot of small irregular pieces of land and unfinished street ends, and also so as to enable a new church, which was proposed to be built in the new area, to be proceeded with.

After referring to traffic routes and road development, he said York was well provided with permanent open spaces, which had a total area of 778 acres. There are also quite a number of smaller permanent open spaces, such as the moats and ramparts of the city walls, small parks and recreation grounds. The Corporation during the last few years had catered most liberally for recreation, and had provided 12 public bowling greens, 11 grass tennis courts, 6 hard tennis courts, and had also levelled very large areas on the Knavesmire for cricket, football, and l and since the commencement of the wa allotments of about 1-16th of an acr have been provided in various parts city.

The development of York from the si century was dealt with, and, in conc the lecturer said with regard to further planning areas, for the greater part th requiring to be town-planned was wit areas of the Escrick Rural District (Fulford area), the Tadcaster Rural Council (Dringhouses area), and the Ouseburn Rural District Council f Acomb area, the latter being the one perhaps required to be dealt with at a date on account of the developments were taking place there.

Mr. W. R. Davidge (London), i posing a vote of thanks to the sp pointed out that in mediæval days the cipal authorities were really regional a ties who were faced by the same probl those which troubled local authorities And the old authorities seemed to have them as well as they were being solved by the Local Government Board Ministry of Health. Many of the

lems were faced in a big way. One big ulty in York, as in so many other large s, was that the local boundary was cir- scribed by those of lesser authorities, it was almost impossible to get the autho- s to see eye to eye. This made it all the necessary to get back to the regional for all the essential services which had e provided by the public. Probably in ity of the world could they get such a plete picture, and such object lessons of had been accomplished in the past, as ork.

R. L. S. Mackenzie, City Surveyor of tol, seconded the motion, which was nly accorded.

The Planning of Mediæval Cities.

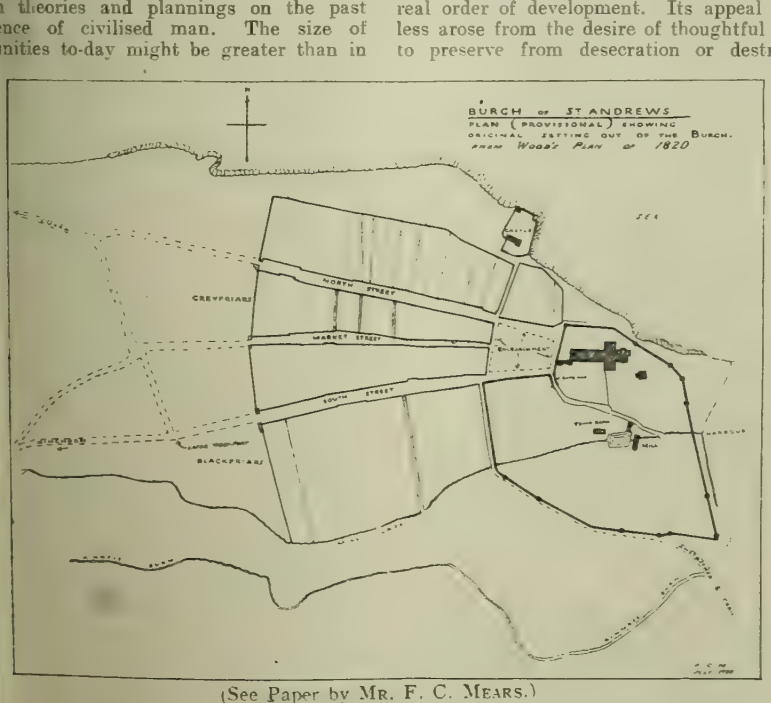
R. F. C. Mears, M.T.P.I., later in the read a paper entitled "The Planning of iæval Cities." He said he had chosen subject because he believed that the acter of our modern planning, and espe- y of reconstruction schemes, necessarily nded on our interpretation of the past. In ly every case modern cities sprang from ediæval or even earlier nucleus. Small gh that might have been it had none less determined the main lines of the ent-day road system. But did not the t of the past go deeper?

uman communities were, like shellfish, ng continuously to their shells; thus n they had to carry a great unwieldy len on their backs, perhaps to become he end literally imprisoned by it. More- . such a shell recorded not only the growth habit of any given species, but in its de- ures from normal form might be found ence of influences or accidents which ted it at the very earliest stage. Thus. they were justified when they based ern theories and plannings on the past rience of civilised man. The size of munities to-day might be greater than in the past, but human needs remained the same —a house, a garden, a highway, a workshop, space for play and recreation, some shrine for the ideal, were not inventions of present-day civilisation. They had all been provided, and in various groupings, throughout the past; so to the past they looked rightly for suggestion and inspiration.

Yet, strangely enough, although the planning of Roman and Renaissance cities had been well-nigh exhaustively studied, the mediæval period, from which most towns had sprung, had received but little attention in Britain. Well-preserved examples of old cities, with their picturesque corners, were admired by all. "All very well!" said the modern practical man, "but look at their crowding and bad sanitary conditions." We used to be almost silenced by that sort of criticism, which indeed largely drove Ruskin and the Romanticists out of popular esteem. But now they learned to decipher the planning of mediæval cities, they found them far better than even Ruskin knew, for the evils with which they were so popularly credited could be shown to be of subsequent growth. They arose, first, through the new intensive warfare which accompanied the Renaissance and Reformation—wars on a scale far beyond anything the Middle Ages can show; and, second, through the corresponding ever-widening rift between country and town which culminated in the late industrial age.

Credit must be given to the initiative of certain pre-war German planners, who founded much of their work on a theory of mediæval town-planning advanced by Camillo Sitte, but it would seem that view did not meet with much acceptance in Britain, perhaps because of an instinctive feeling that it did not meet the facts. He believed the theory to be a wrong one, or, rather, an inversion of the real order of development. Its appeal doubtless arose from the desire of thoughtful people to preserve from desecration or destruction the beautiful sixteenth- and seventeenth-century streets and places of Continental cities. It might be admitted that Sitte was correct in stating that many of the characteristic irregularities in those cities arose from natural traffic lines, but the towns were not planned thus originally.

The difficulty to-day in arriving at an appreciation of mediæval planning might, then, be summed up as due to two causes—



(1) The present reaction against extravagances of the Gothic revival led them to think in terms of systems of streets and squares based on Renaissance or Classical models.

(2) The romantic story writings on which they had all been brought up had made it almost an article of faith that towns of the Middle Ages were always irregular, overcrowded, packed with tall buildings, and highly insanitary. That comforting belief had helped them to justify in part the by-law suburbs of the industrial age as at least an improvement on what went before.

When they undertook a scientific study of mediæval town-planning they had to break down those barriers to understanding, and endeavour to approach the matter with an open mind. That was a matter of great difficulty, because the subjects of study have been superficially altered almost out of recognition. They had also to remember that modern towns might sometimes have grown around small straggling villages or hamlets; or an early village and Norman borough might have been so fused together and overbuilt, as at Saffron Walden, that only by the help of drain-cuttings could the original scheme be traced.

In most old towns hardly a single building, unless the church or castle, could be recognised as belonging to the original setting out, and architects had been content to enjoy the beauty or interest of such places without trying to puzzle out the tangled town plan with the aid of large-scale maps. His introduction to mediæval town-planning happened in course of a holiday in Westmorland, where he stayed at a little village which has preserved its original lay-out almost unaltered. His interest was aroused by the regularity of its plan, while the complete system of long fields surrounding it showed that the lay-out dated from perhaps the twelfth century. There was a rectangular central green, 800 ft. long by 250 ft. wide, with a very tall maypole in the centre, surrounded by a single row of farmhouses; behind these were long garden enclosures with stables and barns; then a back lane encircled the whole, and beyond that were the long strips which had clearly spread out in successive stages as the community prospered. The church, of older origin than the village, lay outside. There was a mill and, at the other end of the village, a broad way leading to the common lands, where the villagers found grazing for their stock, fuel, stone, and lime. A little way off was the small castle or manor house (with no fields), and beyond that a monastic grange, with, again, its compact cultivated area surrounding it. Thus one found in that remote village a complete association of church, government, and people—provision for a completely rounded civilisation.

Next, as one walked over the country, one

(See Paper by Mr. F. C. Mears.)

found a line of similar villages, each near the border between rough Fell and arable land, each with good water supply, and all parallel with a main road running up the Eden Valley. A set of 6-in. maps brought out a further point of interest. Those villages with their long fields showed clearly as units planted in the Waste. They belonged to some early scheme of regional development,

About that time he became associated with Professor Geddes in the preparation of the Survey of Edinburgh, which was shown in the Town-Planning Exhibition of 1910, and in carrying on the study in closer detail was surprised to find that the plan of high-built and overcrowded Edinburgh was closely comparable with that of Milburn, not only in broad outline but in every essential. For there was no doubt whatever that twelfth-century Edinburgh was a formally planned garden city with a density of rather less than four houses to the acre. That conclusion was made possible by the fact that, however much they rebuilt, they found it very difficult to get rid of old property boundaries. In an area like that of the old town of Edinburgh, which had not suffered entire reconstruction during the industrial age, that factor stood out very strongly. The old garden boundaries still existed, though scarcely a square yard remained unbuilt on. Comparison with old maps and with other towns enabled one to lay down with fair accuracy the limits of the twelfth-century plan, and, that done, they might be surprised at its regularity, spaciousness, and civic dignity. Castle, garden city, and abbey were strung out along a mile of the great ridge, on a scale which showed that twelfth-century town-builders lagged no way behind their brethren of any other age. At Edinburgh, too, as at Milburn, were the burgh and abbey mills, the common lands, with a seaport in addition.

A twelfth-century code of laws governing the setting out and civic organisation of such towns still existed in Scotland under the name of the "Laws and Customs of the Four Burghs." Those laws were a Scottish adaptation of southern codes, such as the Laws of Breteuil, and afforded a very clear insight into the burghal life of the twelfth and t teenth centuries. They showed that e burgess was half a farmer, and beyond afforded pointed lessons on how to deal profiteering and other anti-social activi The members of those Scottish commun were knit together in the closest way as brethren owning no lord but the King whose representative each burgess paid yearly rent. In England, under the mili conditions following the Norman Conq the direct relationship with the King was so common as in Scotland, burghs b founded as a rule by barons or churchme

The burghs represented a great eleve and twelfth-century movement of regional velopment. They were almost always laid on clean sites, each central in a well-def region, and formed an essential part of feudal system. They had heard too muc castle and church building and not enc about the complementary burghs. To feudal lord who was not a brigand at h that threefold scheme was a commonpl and it was in that light that they hav regard early mediæval town-planning.

Wars and the industrial age had lar swept away their social organisation buried their gardens in slums, but even the names of some civic dignitaries c them back to this period. Aldermen England, Bailies and Deans of Guild in S land, all traced their office to that great pe of reconstruction.

The threefold unit of castle, burgh and a form, then, with certain adjuncts, the h of the normal eleventh- or twelfth-cen town-plan. Leaving aside the detailed rangements of castle and abbey, and tur to the burgh, they found that it first consi of a row of houses surrounding a mar place. That market-place (commonly angular) might, however, be triangular even irregular in shape. Surrounding market-place were long plots—the Sco Code fixed their area at ¼ acre, while t width might be from 20 to 30 ft. The ho fronted on the market-place, each wit gate beside it for approach to the ga behind. Surrounding the whole was a l lane giving access to each garden from fields and pastures. In the market-p stood a cross or other emblem of civic un The position of the church varied. It m be central, or on one side or end of market-place. Permanent town halls seem have been a later invention. In early t the council met in a temporary struct hence "Tolbooth" in Scotland.

It might be difficult to find in Britain survival of the original houses. They m have been built of timber framing: might safely assume a free use of whitew and also of carving and bright colour, such had survived in gipsy-van building.

The idea of streets had not yet develo The plan was set out to provide for the n of merchants and craftsmen living in s rural conditions around their village green market-place. Those units were "plante consciously and deliberately, at likely s throughout the country, and depended in for their inhabitants on immigrants dr from older units in England or the Contin The castle and abbey stood for administra and defence, religion and culture, respectiv The burgh supplied craftsmen and merch who through their market brought about r prosperous conditions in the surrounding r area, and incidentally helped to sup Superior and Churchmen by their rents dues. The whole process was largely repe in more recent times in colonial forts towns, many of which must, in their e days, have looked strangely like their eleve century forerunners, though lacking the a tectural qualities given by mediæval castle abbey.

The early towns were small in popula but very spacious in lay-out; so spacious fact, that their plans had not been d

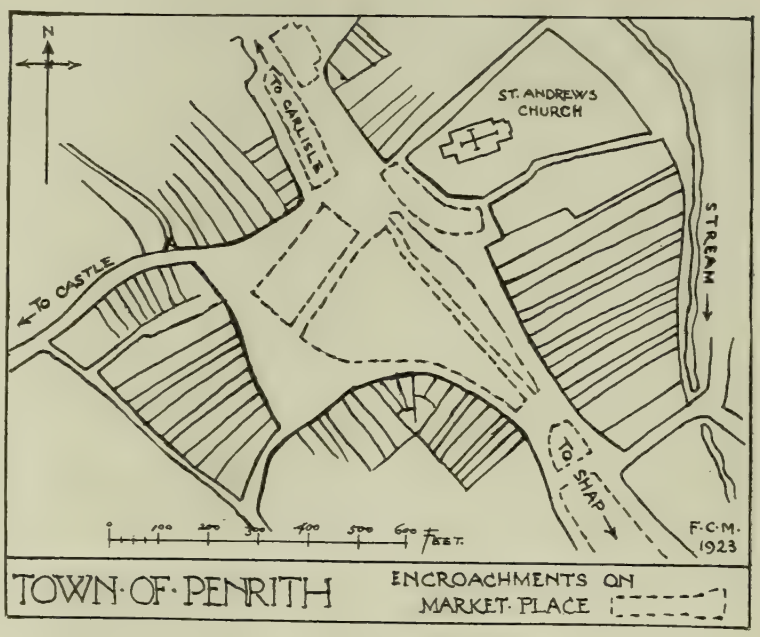
led from the almost unbelievable en-chments which now almost always dis-ed them.



n almost unaltered example was Appleby, Westmorland, which compared very closely Edinburgh. There is a great earthwork le, with its Norman keep, next a clear ary zone, and then the town with its ft.-wide market-place. On each side were houses with their long gardens, and at lower end fronting the castle was the ch; again a plan just as dignified as any-the Renaissance had produced.

Haddington the great market-place was gular—now largely covered with encroach-ts, but still a noble space. Near the broad was the abbey—the castle had disap-ed. Elgin again compared with Edin-h, though on a more level site, but show-very clearly the threefold grouping. St. ews showed one of the finest of all æval plans. The cathedral once fronted spacious square, now built over, from h led three radiating streets focussed on great church. Castle, mills, and port closely grouped around, and the whole ed a remarkable example of planning on great scale. Aberdeen in its early form wed the same general plan as Edinburgh lgin, and countless other examples might ited, such as Beverley and Tynemouth, of which showed a great church ap-ched through a market-place of noble pro-ons.

time went on, the agricultural element in towns declined and their populations be-more urban in character; encroachment pen spaces began, and by the thirteenth ury they had the well-known types of bury, Winchelsea, the Welsh Edwardian s, and the Bastide towns of France.

ffron Walden, in Essex, the subject of of the earliest and most comprehensive surveys, was of great interest as show the earlier and later types side by side. rst was the castle, burgh, and abbey of ping Wealdon, set out according to for-in the clearest way, and with the earlier ement of Romano-British origin close by. n. between these, in days perhaps of the nning of "Saffron" Walden as a town pecialised industry, a new market and iated streets were laid out on the uer system of Salisbury and the Bastide s. The latter, from the modern charac-f their streets, had long been recognised finitely planned, and were commonly re-ed as typical examples of mediæval -planning. They really belonged to a dary stage, and their lay-out showed, gh Salisbury might be excepted, little of maginative character found in the earlier ples. Salisbury was interesting in addi-because it showed a great market-place partly, but still not seriously, encroached The original market-place extended right to the corner where now stood the beau-cross, and the parish church was formerly of the houses which now encircled it. So for the formal towns. They had then rn to the encroachments which destroyed

striking example of encroachment was th, near Milburn, where only with diffi-could one trace the original large et. Encroachment there had been car-to the point common in Continental . and they could thus see how Sitte was d. The old plan showed how over-ng of public spaces had gone on during the past 100 years, but the interesting was that here they could see clearly the led mediæval plan of narrow, twisting s and lanes fitted into the great spaces of welfth or thirteenth centuries. That s came about by degrees. Temporary s erected along the normal traffic lines gradually replaced with more enduring ial, and finally by houses. Sometimes, e town council gave plots on the market-in order to raise funds, so the great

square was covered with irregular buildings, and they got the quaint "places" and charming groupings beloved of the artist. In admiring the trees they had forgotten the wood.

That great change was, perhaps, inevitable in a growing town: the people were becoming specialist merchants and craftsmen, the old large gardens and vast market-place, which must even have afforded grazing, were becoming useless to them, hence they were built over. Town and country were drifting apart in preparation for the industrial age, when men came gradually to think of towns as necessarily slums. Yet the seventeenth-century maps of Blaeu showed great manufacturing centres, such as Mons, as still spacious garden towns. With the exception of ancient and great cities, such as London and Paris, all mediæval towns were such, and only the perverted standard of the last century could have made people think otherwise.

That tragic divorce of town and country might be due to two causes: war and industrialism. Even in the eighteenth century Salisbury was still a place of gardens, and showed running water led through every street. The original lay-out of its "chequers" was very like one of the better modern housing schemes. To-day the same chequer would look a huddled confusion of stores, stables, workshops, and slums. Yet the ordnance map showed the lines of the old garden fences still perfectly clear amid the confusion. And if, with it all, Salisbury remained one of our most charming cities, what was it like with the great new cathedral rising above a sea of cottages and orchards? They must not think of this association of cottage with cathedral as mean or petty, for directly out of that vision of civic life arose such cities as Wells, planned with equal care, but with the added dignity which came from mastery of fine stone. It could be seen how the romantic beauty of such a city as Rothenburg had grown up by the overbuilding of a plan equally regular. They might agree with Camillo Sitte that the beautiful irregularities had been in part governed by traffic needs. But behind all lay a clean-cut design, spacious and regular, healthy and efficient, if not romantically picturesque.

In conclusion, he said the cities of dust and noise and slums, if not of their own making, had largely taken on their present form within the lifetime of people whom they had known. It is up to the present generation to set them right again.

After the papers had been read, a tour of the city was made under the guidance of Messrs. Benson and Spurr, when visits were made to the ruins of the Abbey of St. Leonard, the Guildhall, and other buildings of historical and architectural interest.

Discussion.

A debate, followed by the adjourned discussion on Mr. Spurr's paper, took place at the Station Hotel in the evening, when various questions of special interest to town-planners were discussed.

Mr. Mears referred to the difficulty which might arise when (owing to increasing population, etc.) the spaces left between houses in a district laid out in accordance with garden city principles was filled up by shops. This, he pointed out, would entirely alter the scheme under which the town or garden suburb had been planned. There was also the danger of the shops gradually encroaching to the line of the roadway in cases where the space between the building line and the roadway was in private ownership. During the ensuing discussion Mr. Pepler said he thought the shops should be kept back to the original building line.

Mr. Abbott referred to the question of the ownership of such open spaces in villages as markets, and said he believed in most cases these were not owned by the public authorities, but by the lord of the manor.

Mr. Lovelock said, if an encroachment took place, it was reported to the lord of the manor and a fine had to be paid. He was under the impression that by this procedure a title was established to the encroachment, and to the new line of frontage.

Mr. Cart de Lafontaine said there appeared to be a distinct danger that districts laid out on garden city lines, with adequate width of roads and space between houses, might, in course of time, and by the pressure of the increasing value of frontage in the centre of such a town, gradually become built-up areas. It was difficult to see how this could be prevented.

Mr. Pepler agreed there was a danger of this taking place, but said the question was one with which the controlling authority had power to deal.

Mr. Spurr invited discussion of the town-planning proposals for the city of York, and explained these in some detail with the assistance of maps and diagrams. The general trend of the discussion was that the width of main roads for through traffic should not be less than 100 ft., that at least two new bridges would be required, that it was inadvisable to divert ring roads (intended to prevent through traffic from congesting the central area) too far from the normal line of such traffic, as if

this was done there was a probability that the new roads would not be used.

The question of the possibility of taking a new road across the racecourse was discussed. Mr. Spurr said this would certainly give a more direct route, but he thought it would be impossible to encroach on the racecourse. Several members pointed out that this had presented no great difficulty in other similar cases elsewhere.

Mr. Bruce, Advisory Architect, Manchester and District Joint Town-Planning Committee, referred to the advantages which resulted from co-operation between local authorities in dealing with town-planning in industrial areas on a regional basis.

Mr. Hill, Assistant Town Clerk, Manchester, also spoke on the same subject, and said their experience in Manchester showed that this method of dealing with the question was practical and economical.

Several members joined in the discussion which subsequently took place on the question of the upkeep of roads with grass margins, but no practical solution for dealing with this question on main traffic routes through undeveloped areas was discovered.

An address by the President was then read by his son, Mr. John Mawson.

Mr. Mawson said the greatest difficulty with which the town-planner was faced was that the public regarded him as a man whose business it was to pull down and rebuild a city at ruinous expense, whereas the town-planner was primarily neither house breaker nor builder. His most important function was that of an "inventor of programmes," which might take twenty, fifty, or even a hundred years for its realisation. The function of this programme should be to direct the evolution of the city towards perfect economic efficiency and beauty. With regard to the realisation of these schemes he thought that town-planners should possess their souls in patience, and remember that many of the finest plans were only realised after a long delay—such as Haussmann's great plan for Paris, evolved over seventy years ago and not yet fully realised.

The President referred to the importance of accepting the topographical conditions as a basis for their plans, and made a plea for the greater study of "landscape architecture." He thought the selection of York for their annual conference showed how deeply they were interested in this beautiful city and its unique Minster: they had listened with great interest and appreciation to the paper read by Mr. Benson dealing with the city in the past, and also to those read by Mr. Spurr and Mr. Mears. York would become an inspiration to them, but it would be in the spirit and not the letter that the city would guide their efforts. He thought the question for them, as town-planners, was not so much their ability to copy mediæval or classical models as the genius to interpret the needs and aspirations of to-day and to-morrow. From York they hoped to reap a rich harvest of mental recuperation by the study of those monuments of its aspiring greatness, which had made it one of the most dominating and yet lovable of shrines.

The proceedings terminated with a vote of thanks to the chairman and to the readers of papers, which was carried by acclamation.

Visit to New Earswick Model Village.

On Saturday morning a visit was made to New Earswick Model Village, under the guidance of Mr. Barry Parker, who gave an interesting description of the buildings.

Dinner.

In the evening the Institute entertained their local hosts to dinner at the Station Hotel.

After the loyal toasts had been duly honoured, the Chairman, Mr. Mawson, proposed the health of the guests and the Corporation.

The Sheriff of York, responding to the toast, said they had been very pleased to take part in the interesting meetings and discussions of the past two days. With regard to the replanning of their own city, he thought the most urgent requirement was the building of two new bridges to facilitate through traffic and relieve congestion. He was glad to say they had every confidence in the ability of their City Engineer, Mr. Spurr, to deal in a satisfactory manner with these difficult problems.

The late Lord Mayor of York proposed the Town-Planning Institute, and said that in the unavoidable absence of the Lord Mayor it had given him great pleasure to welcome the Institute to their ancient and historic city. He thought the Town-Planning Institute had a great mission: to ask the world to have a vision of better conditions. Any child born now should have a chance of growing up in decent conditions, such conditions as would make it possible for children to be brought up decently in healthy and beautiful surroundings, very different to the slums and overcrowding which generally existed in our industrial areas.

The President of the Institute, in a brief reply, said that he entirely supported the definition of their aims as given by the last speaker. Their mission, as town-planners, should be to save souls, not by individuals only, but by whole communities.

THE EIGHT-HOUR DAY IN FRANCE.

An interesting correspondence has appeared in the columns of the French journal *Le Bâtiment* in reference to the effect of the eight-hour day on workmen in France, especially in the building trade. M. Picquard, Director of Works, at the International Conference of Building at Prague quoted figures to prove that one result of the eight-hour day was that the workmen drank less. A correspondent contested this, stating that the decrease in drinking was due to many other causes. The Minister replied in a long letter to the editor, saying that his point was that he disagreed with the affirmation that since the application of the law *re* the eight-hour day workmen frequented drinking places more than formerly. From research made by Ministry, figures were forthcoming to s that, especially since 1919, there had been frequent visits to drinking places. This crease resulted from many causes, but ne theless one could not truthfully say, in face of these statistics, that drinking was the increase among workmen.

The Minister also objected to the st ment that the inquiry into the figures been biased. He said that every care been taken to appeal for evidence from pe who were in direct and daily contact with workmen.

In commenting on this letter of the Mini *Le Bâtiment* could not agree with him, stated that at the Prague Conference Picquenard had been asked the direct q tion as to how the workmen filled up the of the day when they ceased work at 4 p and had not replied, except by stating the men frequented drinking places less.

The journal wished that the happy res affirmed by the Minister were true in but it felt rather that the law had paral the whole production of a country which in need of work; in the social order it engendered laziness and idleness, and struck a blow at the individual liberty of worker.

At the Prague Conference M. Verney, V President of the Syndicate of Contractors Public Works in France, had shown clearly why the effect of the eight-hour had been less disastrous than it might h been—namely, that at bottom the Frenchm is, as a general rule, a hard worker and economist. The greater part of the natio composed of small rural proprietors and a culturalists working for their own profit not troubled by the law. Among the w men population many men, at the termi tion of their ordinary day's work, have fo work elsewhere.

In the building trade it has been pro that if the workman always scrupulou obeyed the law, there would be a consequ reduction of 20 per cent. in production, that at a moment when labour is badly nee for reconstruction.

Edinburgh in the 15th Century. (See Paper by Mr. F. C. Mears.)

BUILDING SOCIETIES' ASSOCIATION.

The South Western Counties' branch of the ilding Societies' Association held its annual eting at Exeter Guildhall on Wednesday t week, when Mr. Sidney Andrew was re-cted president, and Mr. A. E. Kernick retary in place of Mr. A. W. Cock.

Mr. C. F. Sanders, a member of the executive the Building Societies' Association, stated t the new Rents Restriction Act had stabilised ts for a further period, but what would affect lding societies very much was the setting free rents from control. The Housing Act of 3, he said, constituted in a sense a new rter for building societies, because it contained for the first time Government recognition of their usefulness. The Small Dwellings Acquisition Acts of the past had been a great failure. In the first twelve years loans had been made by local authorities under the Acts to the amount of £210,000, while building societies advanced in the same period one hundred millions. During the last four years building societies had advanced over eighty million pounds. Now local authorities were permitted to guarantee building societies against loss in order to encourage them to advance larger sums than they could prudently advance upon a safe valuation to-day.

Mr. Sanders observed that in the last four years the cost of building small houses had dropped from £1,000 to £315, and there might be a further decrease. He found a variation of quite fifty per cent. in the prices charged by builders during the last few months which difference might or might not be justified by the quality of the house. He emphasised that co-operation with building societies was the most likely way of encouraging private enterprise. The prevalent rate of interest would eventually fall.

Caution was necessary in borrowing or lending money for long periods on fixed rates, but the constant repayment by instalments of building society mortgages gave those societies an advantage in adaptability compared with other organisations. Nearly a quarter of a million people were purchasing houses through building societies.

No. 9, Poland-street, W.1. Messrs. R. H. Kerr & Son, Architects.

[This building has recently been completed. Messrs. Townsend & Pearson, Ltd., are the builders]

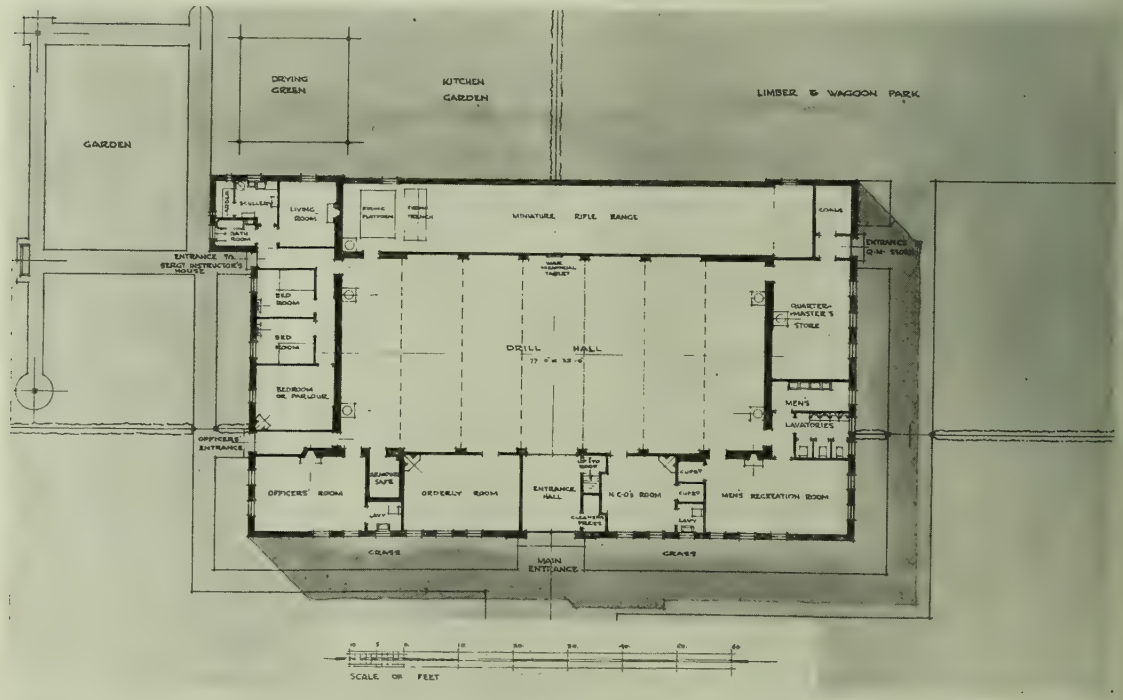
THE INFANTRY DRILL HALL, LATTA-STREET, DUMBARTON.

This building is on an open site of about 1¼ acres, and is set back to leave a parade ground in front. A new street, 40 ft. wide, is being formed, and the building centres on this new street. The entrance to the ground will be by a stone gateway with wrought-iron gates of simple design.

The drill hall is centrally placed, and rises above the surrounding administration rooms and offices, which are one story high. The walls are finished in cement roughcast with broad base and parapet and central doorway in stone-faced blocks. The drill hall roof is covered with Marseilles red tiles, and has a central pediment carrying the flagstaff.

The building is entered by a wide entrance hall finished in facing brick and separated from the drill hall by a folding glazed screen. The drill hall is 77 ft. by 33 ft., and rises to a height of 24 ft. at the apex of the open roof. The walls are finished in facing brick and the roof is of wood on steel principals. The lighting is effected by two large gable windows with segmental arched heads, and a frieze of horizontal windows along the north wall aided by a large window in the pediment already referred to.

Opening from the drill hall is a 25-yd. miniature rifle range of fireproof construction.



The administration rooms consist of orderly room, N.C.O.'s room, officers' room, quartermaster's store, and armoury safe, in addition to a men's recreation room. All these rooms open from the drill hall. On the west side is the sergt.-instructor's house, containing parlour, two bedrooms, bathroom, living room, scullery, larder.

The building is electrically lighted throughout. The heating of the hall, range, and quartermaster's store is by slow combustion stoves, and of the other apartments by coal fires, except the sergt.-instructor's parlour and bedrooms, which have gas fires. Natural ventilation is employed throughout, aided by direct ac extract ventilators in the drill hall.

The construction of the building (with exception of the drill hall roof) is firep throughout, the floors being of concrete fini with wood block flooring, and the roofs of crete and steel finished with asphalte extern

The building is from the design of Me Denny & Blain, of Dumbarton and Glas The schedules were prepared by Messrs. Wilkie & Son, measurers, Dumbarton Glasgow, and the contractors were :—Bu work, Messrs. Leslie Kirk, Ltd., Clydeba joiner work, Messrs. Dougall & Co., Dumbar plumber work, Messrs. Campbell & Came Dumbarton ; roof tile work, Mr. John Bea Dumbarton ; plaster and roughcast, Me Wm. Latto & Son, Clydebank ; painter w Mr. W. S. MacNicol, Dumbarton ; steel w Messrs. Jas. Allan, Senr., & Son, Glasg asphalte work, Messrs. The Scottish Speed Co., Glasgow ; electric light, Mr. Alex D Dumbarton. The clerk of works was M Gourlay, Dumbarton.

New Infantry Drill Hall, Dumbarton.

Messrs. Denny & Blain, Architects.

THE BUILDING TRADE.

THE INCIDENCE OF INSURANCE.—II.

By A SPECIAL CORRESPONDENT.

the previous article a passing remark ed as to the undoubted capability of the insurance companies for managing their ss advantageously. This observation was ced by a recognition of the extreme ance of the "Average Clause" common ordinary fire policies. It was introduced of warning to those who are apt only dily to ignore the far-reaching conse- of such a fundamental proviso. Having ngaged as a consultant and expert witness a long period of years, the writer is able rst-hand experience to testify on behalf companies with whom he was thus ted, that in no instance has any attempt his knowledge of any unfair construction ilable facts. On the contrary, all con- in the conduct of baffling cases behaved anner which justified this opinion about en-handed custom of determining claims y on their merits, and by settling losses ly. It is, however, only reasonable to er that recurring difficulties must bly crop up in dealing with contracts as these are to contingencies often antable and invariably unexpected. This o, it is manifestly an obligation on the all insurers to insist on precision, parti- about all technical matters connected eir business and premises intended to be by a policy when it is issued. If mis- andings are to be provided against, nsurer must plainly set out the exact er of his calling. A world of trouble nsequent loss in countless cases might een obviated by these elementary pre- s. That silence enshrouds such happen- ed cause no amazement, because those ffer realise that the natural comment be "What else could be expected?"

following important case supplies an tion in point. As an outstanding object it deserves to be remembered. The ok place in the old Law Courts adjacent tminster Hall, built by Sir John Soane. stice Manisty presided, and the present was one of the jury. This happened the Law Courts in the Strand were but the judgment is not merely a matter orian history, seeing that the case ranks ecedent because the ultimate settlement due course determined by the House of A paint manufacturer engaged in a ous but comparatively small way of fully insured his factory and its con- ainst fire. The insurance company did ge arson or suggest contributory negli- n the part of the insured, but objected tate. They contended he had violated tract as a manufacturer of paint by Brunswick black. The jury reduced ats to A. viz., "Is Brunswick black a or a paint?" and to B. "Is it the of the trade of a paint manufacturer of ss to make Brunswick black, or is it made by ordinary varnish makers?" y decided in favour of the insurer, Brunswick black is a varnish paint dd colour and, in any case, not a varnish rally understood. No evidence was ov either side as to the custom of the That was, after all, the chief considera- a dispute of this nature, particularly ng occurred in the policy in question ng this maker of paint from making k black. If there was at that time and fast custom as to its manufacture y the insurance company should have a clause accordingly. The insurer day before the King's Bench, also at rt of Appeal, and the House of Lords d the verdict. In the meantime, the urpose of the insurance had been frustrated, seeing that the insurer was kept out of his business meanwhile, and when he did get the policy sum the expenses and loss of trade must have spelt ruin.

Some fires are unaccountable owing to the available evidence being inconclusive and unreliable, necessitating caution on both sides. The event now to be related resulted in a total loss for the insurance company. Only one annual premium had been paid. The facts may thus be briefly enumerated. A new residence, constructed of brick, had just been completed but not occupied. Surrounded by its own grounds it occupied an isolated position, the site being on high ground in full view of the high road in a residential neighbourhood of the well-to-do in Hertfordshire. The place contained no furniture, but the owner was on the eve of moving in. Suddenly the premises were discovered to be on fire and the evening papers recorded the event under a headline about "a mansion burnt out." The building was oddly designed with unusually thick walls on all sides externally, but without any exception the internal walls throughout the premises were merely framed partitions in timber and plaster. As a result, the solid surrounding brickwork appears to have served like an enormous flue, consequently the fire rapidly extended and soon reduced the fabric to a ruin, burning out the contents in a few hours in spite of the efforts of the fire brigade. The brick walls suffered but slight damage. No question arising as to the origin of the outbreak, the insurance company's assessors, in consultation with the writer, acting on behalf of the owner, arrived at a settlement by which the sum set out in the policy was paid forthwith. The rebuilding necessarily depended upon utilising the walls left standing. In doing this, by adding here and cutting away there, the house was so altered that when completed an entirely different arrangement was obtained. Internally, the new divisional walls were carried out in brick, and various new features were introduced, so that in the end the insurer gained considerably. The building was manifestly improved and a first-rate builder was employed. The insurance company having paid on a total loss, left the writer entirely free to carry out the wishes of his client. "The subsequent proceedings interested them no more." The average clause was exempted, seeing that nothing remained to average, the loss being complete.

It is an old proverb, "let him who thinketh he standeth take heed lest he fall," and the following is apropos in this connection. The question of increasing the premium for fire insurance on a big modern church in the Western district of the Metropolis having been under consideration, the writer was consulted by the vicar as to the actual risk involved. He explained that the premises were well covered, and that being the general opinion some members of the parish council declined to agree to any increase. They thought the Belgian marble columns of the nave arcade gave the fabric ample security and minimised the chance of fire reaching the wooden roof. This plea, to that extent, seemed plausible, but actually was based upon wrong premises, inasmuch as this marble under certain conditions, not improbable, might greatly increase the risk involved. Much of the timber in the roof being of small scantlings and boarding would burn freely and fall easily when once set on fire. Should the pitch pine seating throughout the nave start burning, the lower parts of the marble piers would speedily get partially hot and split. When thoroughly heated at their base, these shafts would sever and fly like glass when the fire brigade hose suddenly spread water upon them. Not infrequently the supposed factor of immunity against wreckage by fire turns out the reverse of what was anticipated. The malting case already mentioned and this one serve more than merely professional purposes. Fortunately, so far, nothing unpleasant has actually happened, but the committee accepted the advice and increased this insurance.

A Berkshire photographer's fire was extraordinary on account of the vagaries which make it an example of special interest. The action occupied three days in the Court of King's Bench. The condition of the premises after the fire was quite exceptional, unlike anything of the sort in the writer's experience. The property in question consisted of a large shop situate in the main street of a well-known town. The insured occupied the whole building for his business. The studio was on the first floor and it extended at the rear. A wide wooden staircase formed its approach. Both suffered severely. The room behind the shop was devoted to mounting and touching up photographs. The chimney-piece was constructed of brickwork and carried a wide stone mantelshelf on which a vast collection of glass negatives, packed one upon another, extended up to the ceiling. So intense had been the action of the fire that they were more or less fused and melted into a mass, as might happen in a furnace or by volcanic action. Not an atom of plaster remained on the walls of the room or ceiling. It had come completely off the brickwork, even into the internal angles of the walls, where of course plaster is hard to hack away. About eighteen inches above the floor-level the plastering remained intact as well as the skirting boards and flooring. Over the whole of the apartment some two feet thick of debris largely composed of the fallen plaster from walls and ceiling mingled with a mass of combustible material such as a quantity of light wooden shelvings torn down with the plaster. This rubbish had scarcely burned at all, though strange to relate the brickwork over the fireplace arch had fractured badly from excessive heat. A small stove, placed out in the room, was set in an iron tray below, and an iron pipe carried above through the fire opening into the ordinary flue of the chimney. The explanation offered by the photographer as to the origin of the fire was that this independent stove, left burning when he closed the place for the evening, had set fire to the linoleum. This floor-cloth, like all else in the bottom of the room, was however unharmed. The damage done was entirely upward. The shop was not interfered with, notwithstanding the enormous heat in the adjacent room. This added to the complexity of the case and little doubt remained after a very careful examination that the damage was the result of an explosion. How otherwise could the sudden wreckage of the plastering be explained? It was urged that the neighbours heard no explosion. The room was shut in and surrounded by tall brick walls on the side and rear, screening the adjoining buildings. The street was full of traffic and a busy thoroughfare. Noiseless powders and other explosives or chemical preparations possibly might be available without necessarily audible results. Judging from the remains and ruins, a waterpot with a long spout had been seemingly tilted on the stove and slung from an easel (formerly in the shop) with the outlet of the spout fixed towards the negatives, thus accounting for the excessive heat concentrated upon them. Whatever the concoction in the pot may have been it was heated up by the stove immediately below, and the spout acted like a blow-pipe till the whole thing burst, bringing off the plaster by concussion. No amount of ordinary fire action would burn off plaster—one of the most fire-resisting materials known.

The concluding case—a costly affair—caused a trial and an arbitration before the Official Referee. Its interest consists in upholding the rights of the insurance company to reinstate.

The owner of a large steam laundry in Wales, comprising several old buildings two floors high, was the scene of an unexplainable fire, which happened a few days after the proprietor had transferred his insurance, on an increased amount, to another company, but he had only paid the deposit money. Time had not been allowed for the issue of the policy. To ascertain the damage a well-known firm of contractors acting under the direction of the writer on the spot, made an exact record of the salvage and prepared an estimate of cost for reinstatement. A firm of engineers and an expert made a schedule and prices for renewals of the machinery. The insurance company, in accordance with the terms of the policy, were ready to effect a case of *statu quo*, or, as an alternative, to pay over in cash the estimated cost. The proprietor wanted a new laundry set out with one-floor buildings, and declined the company's proposals. The referee visited the premises and an endeavour was made at the Law Courts towards a settlement. Meanwhile other matters, with which the writer was not concerned, cropped up, and it was understood the business took an entirely different turn. The only point of interest here is that the company could not be compelled to do more than reinstate or pay an equivalent lump sum in cash.

LOANS TO BUILDERS.

The Newport (Mon.) Corporation Finance Committee has decided to make something of a departure from the usual method of assisting private building. The Committee at a meeting on October 9 considered what assistance should be given to private enterprise by way of loan under the Housing Act, and decided that loans be not made under the Small Dwellings Acquisition Act, 1899, but under the following local conditions of agreement, subject to assent by the Ministry of Health :—

(a) Loans to be advanced for building of subsidy houses up to a maximum of 85 per cent. of the market value of the house as ascertained by the Borough Engineer and Borough Treasurer.

(b) In respect to houses larger than subsidy houses, but having a valuation not exceeding £1,500 loan up to a maximum of 80 per cent. of the ascertained market value.

(c) That the loan shall be made during the course of erection of the houses, provided that the total of the loan does not at any time exceed during the course of construction 50 per cent. of value of work actually done.

The Committee decided that the above detailed loans be given to builders, owner-occupiers for whom house is built, and others upon following conditions :—

(a) Insurance of house to agreed amount.

(b) Loans to be repayable in equal half-yearly amounts, principal and interest, at 5 per cent. over a period of twenty years, and

(c) Repayment of outstanding balance of loan to be accepted by Corporation at any time.

The only other conditions are payment by borrower of agreement costs and that buildings shall be erected within the borough.

The conditions of loan mark an important step in the subsidisation of building.

The decisions are subject to Corporation approval, but providing the Ministry agrees, this is purely formal in that the Finance Committee is the full Council sitting in committee.

Houses for Employees.

The Bristol Housing Committee has decided to let ten plots of land on the Fishponds housing estate to Messrs. E. S. & A. Robinson, Ltd., at an annual rent of £25 for 999 years. It is the intention of the firm to erect houses for their employees. The chairman of the Committee has expressed a hope that other large employers of labour will follow the example of Messrs. Robinson, as such schemes would go far to help solve the housing problem.

HOUSING AND HEALTH EXHIBITION, GLASGOW.

The Corporation of Glasgow has again promoted a well-organised Exhibition for the purpose of solving the numerous problems which still remain uppermost in the minds of the public in their desire to secure the "Perfect home."

The Exhibition was opened in Kelvin Hall, Glasgow, on October 1, by Sir Thomas Lipton, Bart., who said housing and health were of the greatest importance to every city, and he was glad to see that it took a prominent place in Glasgow.

The Lord Provost, Sir Thomas Paxton, presided, and during the course of his speech intimated that this was the fifth Housing and Health Exhibition that had been held in Kelvin Hall under the auspices of the Corporation, and it was because they were satisfied of the usefulness and importance of these Exhibitions that they continued to organise them. Their purpose was to instil into the minds of the public a due appreciation of the principles of health and hygiene; to show by the numerous exhibits how a man's home might be his castle; and that it was within the scope of those of moderate incomes to possess houses of their own.

The Exhibition this year is conducted on somewhat different lines from the previous ones. Considerable attention has been given to building materials, sanitary appliances, lighting, heating, labour-saving appliances, decoration and furnishing, and appliances for home nursing and welfare; but recreations, hobbies and study, photography, wireless transmission and reception, dressmaking and millinery, and literature on the exhibits and objects of the Exhibition occupy, perhaps, the largest part of the Exhibition, whilst the greatest credit is reflected on those whose strenuous efforts were exerted in producing the Exhibition, one feels inclined to state, for the benefit and greater success of future projects, that less attention should be given to many of the latter items and a greater concentration on the former.

One of the finest exhibits in the hall is that of Mr. Maxwell M. Hart, landscape architect, Glasgow, who has a decorative lay-out for a rock garden and lawn, which include a waterfall and stream. The rock garden is constructed in Westmorland stone and set with a selection of Alpine plants and conifers. The lawn is crossed by winding paths laid with random flagging; there is a bridge crossing the stream, a thatched summer house, a dovecote and an arch, all built of rustic timber; a sundial, statuettes, and other ornaments to harmonise. The scheme is equally suitable for the grounds of a country house or suburban villa. The comprehensive character of the display may be understood when it is explained that 100 tons of material have been used. It is stated that a rock garden of the size has not hitherto been seen indoors in Scotland.

Types of window blinds and fittings may be seen in great variety at the stand of Messrs. James Meighan & Son, of Glasgow. The firm's blinds are shown fitted to different types of house windows, so that visitors can see exactly the finished effect of the articles, and so that the working can be fully demonstrated.

Specimens of stair treads, floorings, and stair nosings, are shown by Messrs. Ferodo, Ltd., of Chapel-en-le-Frith, including models showing how the firm's stair treads and nosings are fitted to all types of new and worn steps in wood, stone, marble, or concrete. They are made of specially woven cotton and bonded by the "Ferodo" method, which gives great durability. They grip equally firmly when worn as when first fitted, being of the same quality throughout, while the colours are permanent. The treads are supplied in three colours: maroon, brown, and dark green.

Housewives will be interested in the full range of automatic washers and boilers shown by the South Middlesex Manufacturing Kingston-on-Thames. These applianc fitted for gas, oil, or electricity, an actual working is demonstrated. A washer of interest is the "Solos," sh Messrs. Johnston & Clark, of Whitei has no moving parts, and the articles subject to any wear and tear because and scrubbing are eliminated. The was fitted for oil, gas, or electricity, are copper or galvanised steel, and are suitable for use in housing schemes.

A special selection of heating and apparatus is shown by Messrs. Murdoc & Co., of Glasgow. One of their most int appliances is the "Eco" combined h boiler and gas or electric cooker. In boiler gives sufficient hot-water for all d purposes and also heats radiators an rails, while the heat from the boiler directed round the gas or electric oven, when the boiler is in use the "Eco" more or less like an ordinary range for c and gas or electricity is always availabl required. The apparatus is very comp requires no brickwork in fixing. A an electric "Eco" are on show. Th known "Kalor" independent boiler is the stand, as also is a steel coke bunker holds two or three days' supply. A sele copper boilers are also shown, also ta washhouse boiler, while in the section to the rapid heating of hot water th various types of geysers for household p

The Corporation of Glasgow is repr by two of its principal department Gas Department has two stands; of th is named the "Fire Station," and is de in the red and gold usually associated stations. This description is literally for on the stand there are massed 500 g It would appear from these that any fire-place can be matched, as the gas show are finished in burnished brass, oxidised copper, and black. The stand ing the "Fire Station" is also on nove being formed on three sides by gas One end is fitted as a kitchen, and a sounding board has been fixed in the s a roof, so as to enable the demonstrator easily heard when they are explaini efficiency and ease of cooking by means

On another stand the Corporation Ele Department has an interesting disp apparatus. Electrical appliances, suc example, as machinery in operation, are interesting, and are especially so wh appliances on view are not unattainab may be installed in one's own house o terms. Desirable as electric labour-sav the home undoubtedly are, the fact t till recently it has generally only been to acquire them by purchase has m against their general adoption. This has now been removed in Glasgow, as electric cookers and electric fires are con An electric cooker may now be fitted payment of a nominal rental, and the operation and the results are being strated daily at the Corporation stand. first time also it is possible to have fires fitted in bedrooms, dining-rooms, or rooms, on payment of a small annual and the various types of fires availat displayed. There is also the usual vari clothes and dish-washing machines, v cleaners, irons, &c., all shown working growing use of these will do much to m the smoke nuisance in large cities. Elec it need hardly be added, stands for a atmosphere within the home.

Another phase of the Corporation's a is illustrated by the Child Welfare which has been organised under the Health Department with the approv assistance of Baillie James H. Allan, t vener, and Dr. A. K. Chalmers, the City Officer of Health. Between the hours a.m. and 4.30 p.m. part of the daily of the crèche is demonstrated by childre the Cowcaddens Day Nursery and the Park Kindergarten.

NOTES ON CONCRETE.

By A CONCRETE SPECIALIST.

SETTING AND HARDENING.

HERE is much confusion among the users cement in the employment of the term ick-setting cement." A builder or contrac- will frequently call for a quick-setting nt, when what he is really seeking is a *k-hardening* cement. A quick-setting cement lefined by the British Standard Specifica- is one which completes its set in less than an hour; such a cement is seldom needed would be unusable under ordinary condi- of mixing and laying concrete. A quick- ng cement is, in fact, only intended for under water or between tides, and special ng arrangements are necessary so that the ar or concrete is very rapidly mixed and sited in the brief period before setting nences.

rdinary cement as defined by the British dard Specification does not commence to in less than 20 minutes and completes its n a period not exceeding ten hours; it is, ever, exceptional for cement to take more seven hours to set at ordinary tempera- s. These figures refer to neat cement n reality have little interest for the concreter requires (1) a reasonable time for mixing laying his concrete before setting com- es, and (2) that his concrete should be enough for building upon in 18 or 24 hours. initial set of the cement indicates the time lable for mixing and deposition before ng commences, but the final set of the nt is no guide at all as to whether the rete will be hard in 18 or 24 hours. Some nts of 7-hours final set will yield a harder rete at 24 hours than other cements of urs final set. A test that would be a guide howing the early hardening properties of nt is a tensile strength test at 24 hours, this is at present not generally applied. uick-hardening cement is undoubtedly of value in almost all classes of building , and those brands of cement which possess characteristic are deservedly popular.

tempts are sometimes made by men ged in certain classes of work to hasten etting of cement by adding washing soda e mortar or the gauging water. This is, ver, a dangerous measure, because the tity of soda required varies with every nt, and there is considerable risk of adding nuch soda, thus causing the cement to ne so rapid in setting that it is "killed" e, i.e., its initial set is disturbed during rocess of mixing and laying the mortar ncrete.

obtain the opposite effect, viz., to make nt unusually slow in setting, alum is onally mixed with the mortar or gauging This, again, is not desirable, because ddition of alum increases the sulphur nt in the cement and may be a cause of egration. The resources of modern cement facturers are many, and when cement of l setting properties is needed the simplest fest plan is to inform the manufacturers requirements and leave them to produce quired article by scientific means.

The Colour of Portland Cement.

colour of Portland cement is no guide quality, because good cement can range pure white to almost black in colour. hief of the factors which influence the of cement is the proportion of iron it contains. A white cement contains an one per cent. of this constituent, ry cement contains about three per f iron oxide, and the special cements, ark in colour, which have been made -water resistance, contain up to 10 per f oxide of iron. The absence or presence of iron oxide is not known to have any influence upon the quality of cement, and in the sea-water resisting cements referred to the function of the iron oxide is merely to replace alumina, which is thought to be a source of danger in cements subjected to the action of sea-water.

The colour of cement is also influenced to some extent by the class of fuel with which it is calcined or burnt in the rotary kiln. Most of the cement of to-day is calcined in long, rotating, slightly-inclined cylinders by a flame of powdered coal, and if a good bituminous coal is used the clinker (which on grinding produces cement) is almost black in colour. If, however, anthracite coal is used for the flame, then the clinker is usually brown in colour, and produces a brown cement. The colour, after mixing with water and setting, is normal, and the quality is indistinguishable from cement of the usual grey colour.

A certain amount of cement is still calcined in stationary brick kilns, known as chamber kilns and shaft kilns, where the fuel is either intimately mixed with the raw material or fed to the kiln in alternate layers with the raw material. The clinker from these kilns produces a light grey cement, but if the calcination is thorough the quality of the cement is above reproach.

There are thus three causes, viz., content of iron oxide, class of fuel used for calcination, and type of kiln employed, which may affect the colour of cement without altering its quality, so that the condemnation of a cement for its resemblance to lime or other peculiarity of colour is usually incorrect and based on false premises. It is true that incomplete calcination will cause a cement to be light-coloured, but it is only one of four factors which operate in the same direction, and hence colour alone is no guide to the degree of calcination.

White Portland cement is not made in this country, but it is imported from America, a circumstance which cannot fail to enhance the price compared with ordinary cement, so that when absolute whiteness is not essential, light-coloured cements are in demand either for use alone or mixed with white material such as powdered chalk or barytes in conjunction with white sand and aggregate to produce a concrete approaching whiteness.

Concrete of other colours, as blue, green, red, and yellow, can be obtained by mixing suitable pigments with cement, but it is important that only mineral pigments be used.

The Storage of Portland Cement.

In a climate like that of Great Britain the storage of Portland cement has never been free from difficulties, and as the cement of to-day is more finely ground than ever the difficulties of storing without damage are increasing. Portland cement has a great avidity for water and will readily absorb moisture from the atmosphere or from damp materials in contact with it. The absorption by cement of 1 per cent. or 2 per cent. of water has no appreciable effect, but further amounts of absorption retard the hardening of the cement and reduce its strength. If the absorption exceeds 5 per cent. the cement is, for all ordinary purposes, ruined. The British Standard Specification for Portland cement recognises the deleterious effect of water in cement by limiting the "loss on ignition"—an item covering water and carbonic anhydride, but principally the former—to 3 per cent. The more finely a cement is ground the more active it is, and consequently the more rapidly does it absorb moisture from damp surroundings, so that, as previously mentioned, the finely-ground modern cements are more susceptible to damage than the cements of twenty years ago. Builders and builders' merchants whose consumption or sale of cement is small, who sometimes are unable to dispose of a consignment of minimum quantity within a month, are particularly liable to loss through damage during storage.

The best method of storage is that adopted by the cement manufacturers, viz., in bulk; and bins of loose cement 6 ft. or more in depth can lie for longer than a year with no more damage than the formation of a crust on the surface about 2 in. thick, which must be removed before the cement is taken for use. It need hardly be added that the walls and floor of the cement bin must be damp-proof. Hence, if prolonged storage of cement is seen to be unavoidable, it is better to empty it from the sacks and stack it in as deep a heap as possible in a building of which the walls and floor are non-porous, the latter being preferably concrete, or of timber raised from the ground a foot or so with an air-space below.

When cement is stored in sacks absorption takes place from the air through the sack on all sides which are not in contact with other sacks. It is then only a matter of time before sufficient water is absorbed to injure the cement, and it can only be fully realised from experience in the British climate how quickly cement in sacks becomes lumpy and "air-set."

There are some who consider that they have provided perfect storage when the walls, floor and roof of the building are damp-proof, but this idea is held in ignorance of the fact that cement absorbs moisture from the air even when the latter is not perceptibly damp; nothing but an absolutely air-tight building can be classed as perfect storage.

Indications of damage by storage are given by the cement becoming lumpy, and when this happens the lumps should be screened out unless they are soft enough to be crumbled in the fingers. If cement which has become lumpy is to be used for reinforced concrete or other important work it is advisable to send a sample to the manufacturers or other expert testers to ascertain whether the strength and setting properties have been seriously affected. When cement is badly damaged it can sometimes be used in the mortar mill for "compo." without incurring the expense of screening out the lumps.

When a building of a temporary character is required for the storage of cement in sacks, the floor can be made damp-proof by constructing it with a double layer of boards with tarred paper between. The walls can also be made damp-proof with one or two layers of tarred paper applied internally, and the roof should be externally protected with tarred felt. For a permanent cement store a concrete building should be considered, but the concrete must be dense to be waterproof and should be allowed to dry out before the building is used. The cement, whether loose or in sacks, should be kept from contact with a new concrete floor by boards. When storing cement in sacks the latter should not be in contact with the outer walls of the building. When sacks of cement are stored several tiers high the pressure upon the lower sacks is sufficient to consolidate the cement, and may give the impression that the cement is air-set. The caking due to consolidation will, however, quickly disappear if the sack is rolled on the floor.

A Builder Lord Mayor of Newcastle.

Mr. Stephen Easten, of Newcastle, who has been unanimously selected Lord Mayor of Newcastle, is one of the most prominent builders and contractors in that city, and is an ex-President of the National Federation of Building Trades Employers and Chairman of the National Wages and Conditions Council. The Lady-Mayoress elect is his only daughter. Mr. Easten went to Newcastle in 1887 and entered the Council in 1906, and was Sheriff of the City in 1917.

THE LAW SOCIETY AND THE RENT ACT.

At the recent meeting of the Law Society at Plymouth, the President referred briefly to the Rent Acts, and especially pronounced the worst feature of this legislation to be the continued control of mortgages. He is reported as having said capital available for loan on mortgage was now abundant, and the continuance of control would decrease confidence and further divert capital from house building.

Mr. E. A. Alexander (London) read a paper on "Housing and Rent Control," and in the discussion which followed the members of the Society unanimously emphasised the urgent necessity for the removal of restrictions with regard to mortgages. In the course of his paper Mr. Alexander referred to the continued control of mortgages as the greatest blot on the new Rent Act, and he said another serious defect was the absence of a judicial "standard rent" for houses not actually let on August 4, 1914.

In our issue for July 20 last we drew attention to the defect in the definition of "standard rent," and we showed that that was not the only defect in the definition.

As regards Part II of the new Act, which is not to come into operation until midsummer, 1925, Mr. Alexander intimated his opinion that in this period of less than two years there would be no change in the circumstances which had rendered control necessary, and if full control were justified in 1923 it would be almost equally justified in 1925, and the Government of that day would have to decide whether it would adopt "the nebulous provisions" of Part II or whether it would adopt a new policy. He then suggested that if in 1925 trade had improved substantially there would seem no reason why further increases at the rate of ten per cent. per annum should not be allowed until the permitted rents had reached economic level.

We have recently discussed the question of housing and the Rent Acts (see *The Builder*, October 5), and we endeavoured to show that there was no reasonable connection between the production of houses and the continuance of rent restriction, for restriction only benefited an ever-increasing number of people, whilst every person occupying a house or a converted flat which was built or converted since April, 1919, had to face economic conditions. The continuance of restriction is harmful in two ways: it discourages building, for people take the protected houses and will not go into the open market for the unrestricted new houses; and it encourages overcrowding, since people press into restricted houses. We agree that a process of levelling up is necessary, but we contend this should not be deferred, but should commence from the earliest possible date.

It is not out of place in connection with rent restriction to note some general observations made by the President of the Law Society in a very excellent address on the law and modern legislation, as he pointed out that at the present time there was a great danger of the greater issues for which the law stood being compromised by unedifying disputes about legal coercion in lesser matters. At various times the State had thought fit to interfere in domestic concerns that should be left open to private choice, but the venerable position the law occupied could only be retained if it ceased to meddle in the legitimate domain of private freedom and further extreme measures of social reform. These observations are true of a great deal of modern legislation.

Whilst referring to the proceedings at this meeting we may mention that Mr. H. F. Brown (Chester) read a paper on "Easements and the Law of Property Act," in which he advocated an amendment of the law relating to the requisition of easements by prescription or by the fiction of a lost grant, especially in the case of easements of light and support.

In our Legal Section for September 28 we noted a case in which this fiction of a grant enabled the Court to get over a serious injustice and to administer the law upon a common-sense basis, but the easement in question in that case was a right of way.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Ev endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur

	Masons.	Brick-layers.	Car-penters, Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Brick-Masons' layers' Labourers.	Pl ter

(For rates of wages in the Building Trade in Scotland, see page 585.)

CONTRACTS, COMPETITIONS, &c.

me contracts still open, but not included in this List, see previous issues. Those with an asterisk ertised in this number. Certain conditions beyond those given in the following information osed in some cases, such as that advertisers do not bind themselves to accept the lowest or any that a fair wages clause shall be observed; that no allowance will be made for tenders; and osits are returned on receipt of a bona-fide tender unless stated to the contrary.

ate given at the commencement of each paragraph is the latest date when the tender, or the names willing to submit tenders, may be sent in; the name and address at the end is the person from whom where quantities, forms of tender, &c., may be obtained.

JILDING AND PANTING.

R 12.—**Coventry.**—DEMOLITION WORK.—lition work at the head Post Office, Coventry. mmissioners of His Majesty's Office of Works. Branch, H.M.O.W., King Charles-street, S.W.1. Deposit £1 1s. (payable to the .

R 13.—**Leeds.**—EXTENSIONS.—Additions to hall at the Imbecile Wards, and extensions becile Wards at the Township Infirmary, for of Guardians. Messrs. Chorley & Gribbon, lace, Leeds.

R 13.—**Porth (Rhondda).**—LIBRARY, &C.—on cf, for the Committee of the Institute of rthyr Colliery workmen, a library and at Pontypridd-road, Porth. Mr. A. E. architect, South Lea, Mount Pleasant, ondda). Deposit £3 3s.

R 13.—**Tilbury, Essex.**—HOUSES.—Erection r 125 houses in Tilbury, for the U.D.C. Mr. ckner, Clerk to the Council, Council Offices,

R 13.—**Wycombe.**—BATHROOM.—For build-room at Children's Home at Bledlow, for the Guardians. Mr. B. L. Reynolds, Clerk, 12, eet, High Wycombe.

R 15.—**Carlisle.**—DOORS.—For making and ving doors, &c., at entrance to covered market ch-street, for the T.C. Mr. Henry C. Marks, neer, 18, Fisher-street, Carlisle.

R 15.—**Charlton.**—HOUSES.—For the erec-0 houses in two sections on the Charlton Estate, for the Metropolitan Borough of . Town Clerk's Department, Town Hall, . Deposit £2 2s.

R 15.—**Darlington.**—ALTERATIONS.—For new alterations to bar at Conservative Club. t the Club.

R 15.—**Felixstowe.**—PAINTING.—For exterior f the Suffolk Convalescent Home, Felixstowe. the Home.

R 15.—**Fermoy.**—HOUSES.—Erection and n of eight five-roomed dwellings, construction mains, main sewer extension and manholes, ne U.D.C. Mr. Wm. Sheehan, Clerk, Offices,

R 15.—**Huddersfield.**—HOUSE.—Erection of a ouse in Luck-lane, Paddock, Huddersfield. nn & Kaye, architects, Milnsbridge.

R 15.—**Liverpool.**—SCHOOL.—Erection of the High School, in Queen's-drive, Walton, for Land Steward and Surveyor (Architectural unicipal Buildings, Liverpool. Deposit £3 3s.

R 15.—**Orpington.**—ALTERATIONS.—Addi-, to premises, for the *Kentish District Times ish Times*, Bromley.

R 15.—**Pontlottyn (Glam).**—TRANSFORMER —For erecting, for the Gellygaer U.D.C., a r station at Pontlottyn. Mr. F. Read, .E., Council Offices, Hengoed (Glam). 1s.

15.—**Risehow.**—HOUSES.—Erection of four Risehow, Maryport, for the Risehow Colliery Mr. H. Oldfield, architect, Workington.

15.—**Salford.**—GARAGE.—For building a age adjoining the Central Fire Station, for Borough Engineer, Town Hall, Salford. 2s.

15.—**Skinburness.**—HOUSE.—Erection of a t Skinburness, for Mr. W. Bradley. Mr. H. rchitect, Workington.

15.—**Steyning.**—PAINTING, &C.—(a) Paint-ning work in Nurses' Home, (b) erection of joining the Nursery, for the Board of Mr. A. Flowers, Clerk, Union Offices, by-Sea.

15.—**Trim.**—SCHOOL.—Erection of school ry Rev. T. Mulvany. Messrs. Morris & 68, Harcourt-street, Dublin. Deposit

15.—**Wolverhampton.**—COLLEGE.—For and completion of a new Technical College. Mr. S. A. Warren, Direction of Education, Offices, North-street, Wolverhampton. 3s. to Borough Treasurer, Town Hall.

16.—**Farnworth.**—HOUSES.—Erection of nd roads and sewers, for the U.D.C. Mr. T. eyor, Town Hall, Farnworth. Deposit £2.

16.—**Liverpool.**—EXTENSION.—Extension Home at Alder Hey Hospital, for the West Mr. Ernest B. Bailey, F.S.I., 9, Cook-rpool. Deposit £2 2s.

16.—**Liverpool.**—PAINTING.—For external ., at Mill-road Infirmary, Liverpool, for the B.G. Works Department, Belmont-road Liverpool.

16.—**London, W.**—EMPLOYMENT EX-rection of Edgware-road Employment W., for the Commissioners of H.M. Office Contracts Branch, H.M.O.W., King et, London, S.W.1. Deposit £1 1s. (payable ary).

16.—**Margate.**—PAVILION.—Erection of a mber bathing pavilion, for the T.C. Mr. Borough Engineer, 13, Grosvenor-place, Deposit £5.

OCTOBER 16.—**Neath.**—HOUSES.—The B.C. invite tenders for the erection of 30 houses (parlour type), in blocks of two and four, on the Westernmoor site. Mr. H. Alex. Clarke, Borough Engineer, Gwynhall, Neath. Deposit £3 3s.

OCTOBER 16.—**Plymouth.**—ALTERATIONS.—For alterations at the Central Police Court, for the T.C. Mr. J. Wibberley, Borough Engineer, Municipal Offices, Plymouth.

OCTOBER 16.—**Plymouth.**—PAVILIONS, &C.—Erection of pavilions and conveniences at Tothill Recreation Ground, for the T.C. Mr. J. Wibberley, Borough Engineer, Municipal Offices, Plymouth. Deposit £2 2s.

OCTOBER 16.—**Stocksbridge.**—HOUSES.—Erection of four houses, for the U.D.C. Mr. J. N. Singleton, Surveyor, Council Offices, Stocksbridge.

★OCTOBER 22.—**Chesterfield.**—Building Inspector required by the Borough T.C. Mr. Vincent Smith, Borough Engineer and Surveyor. Borough Surveyor's Office, 2, Gluman Gate, Chesterfield.

MECHANICAL APPLIANCES USED IN BUILDING.

ADDRESSING a large gathering of building and architectural students at the Northern Polytechnic Institute, Holloway-road, London, N., on the subject of "Mechanical Appliances used in Building," Mr. J. H. Bennetts (of Messrs. Holland & Hannen and Cubitt) said the Polytechnic was opening a new field in which there was much to exploit, and in which there was plenty of room for them to get a grip of the things that would help in business. They could not walk along Oxford-street, Regent-street, and some of the other main roads of London without realising that we were making rapid strides just now in mechanical aids to building.

Take, for instance, Peter Robinson's or Adelaide House, near London Bridge. There were points that the youth of to-day and junior members of firms wanted to consider, and to consider very carefully. As they knew, plant sometimes, if kept in stock a long time, instead of being an asset in a firm's balance-sheet gradually dwindled until it became a liability. It cost money for storage and for upkeep, and sometimes it had been kept so long that it was only scrap-iron, and hardly paid the cost of breaking up.

It was necessary to remember that a man did not get any capital return on money expended until he could use a building. To give a man a quicker return the builder must either speed up the job or save labour and make it easier for a man to do his work. In order to get a full output from the steam navvy they must be able to get their material away quickly. If they got a spot where only one cart could get in at a time, and that cart had to draw out and another back in, they were not getting full value out of a steam navvy. The steam navvy should be put down in such a way that it fed as quickly as it gave up. Every site should be treated on its merits, and each plot should be plotted out from the very start. The question of plant should not be left until someone found out that it was really wanted. Someone should have foresight and understanding, and if they were going to get the benefit out of plant they must not wait until they had spent a lot of time and labour doing work which would be done by plant much more readily and economically.

Mr. Bennetts went on to speak of cranes, and, on the subject of power, remarked that the builder was trying to use electric current where available. It was really more economical than using steam boilers, and then there was the insurance and inspections, and getting up in the morning to get the steam up. Steam boilers belonged to bygone days. He thought that a job near Moorgate Station was the first in London to go to the expense of putting up a hoist for workmen.

Speaking of concrete block-making machines, Mr. Bennetts observed that when bricks were at such fearful prices nearly everybody wanted to do something with concrete. Men were at the front, and there was really great difficulty in getting bricks. Thousands of concrete blocks were used in a large factory job he had at Stockton-on-Tees. The blocks were made with the machines by girls, who did their work very well. He did not know that he should like to run jobs with concrete bricks to-day. They knew the basements there were in London, and they saw sand, ballast and bricks shot down in the bottom and all picked up again, whereas they could use gravity and by putting up a little bin save labour.

Touching on mortar-mills, Mr. Bennetts said that in the North far more mortar was used than in London. They were favoured in London by having so much sand and ballast available and ready to hand. The lecturer dealt with other building machinery, and the lecture throughout was illustrated by lantern views.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERYSTWYTH.—An inquiry is to be conducted by Ministry of Health into proposal of T.C. to borrow £23,000 for additional sewers scheme and sewerage disposal.

AMMANFORD.—Negotiations are proceeding for the lay-out of new road at Tirydail by the Council and Dynevor Estate. The road will have 20 ft. carriageway and 6 ft., each side, footpaths. The Brynmawr is also to be terraced and a carriage-way of 14 ft. laid down. The U.D.C. is promoting a housing scheme.

AUDENSHAW.—Plans passed by U.D.C.: House, Audenshaw-road, for John Eastwood.

BARNARD CASTLE.—The U.D.C. have approved plans for the erection of 81 houses at Harmire-road and 25 houses in Green-lane.

OSSETT.—Two fires have occurred in the town, viz., at Paleside Mills, occupied by Messrs. F. Lawrence & Sons, and at Springfield Mills, owned by Messrs. Jessop Bros.

Builders and Housing.

A CORRESPONDENT writes to the *Daily Telegraph*:—

"The Ministry of Health is receiving representations from all over the country as to the hard position in which private builders find themselves as a result of commencing building operations under the official circular of April 27, which promised retrospective action in the cases of approved structures. Apparently when these builders obtained sanction of their plans by the local councils they thought the official approval after the Act had passed would be largely a matter of form, provided they complied with the Act; but the Ministry now refuses the subsidy to any house started before actual official sanction was obtained.

"Members of Parliament all over the country are receiving letters from constituents accusing the Ministry of bad faith, and laying stress on the serious financial position in which the writers find themselves through failure of the anticipated subsidy; and this is especially so among the working-classes, many of whom built and are building small houses for themselves. The Government, despite appeals, has not expressed any opinion on the representations made to it in favour of generous treatment to those builders whose only error—if it was one at all—was too great enthusiasm to construct; but if there continues to be silence the matter will undoubtedly be raised in the House when it meets by representatives of all parties."

STEER, LTD. (192,771). Registered er 29. 8, Carfrae-terrace, Plymouth. and contractor, now carried on by ohn Steer, at 8, Carfrae-terrace, Plyand elsewhere, under the style of A. J. Nominal capital, £10,000.

nstruction in Building Subjects.

urses of instruction in building subjects, der the auspices of the Builders' Mer- Alliance, Ltd., at their offices, Finsbury- nsbury Pavement, E.C. 1, are held every ay and Thursday, and over 100 s attend each evening.

NEW BUILDINGS IN SCOTLAND.

Falkirk.—HOUSES.—The Corporation Housing Committee proposes to prepare a scheme for the erection of 200 workmen's houses on suitable sites within the town.

Dumbarton.—HOUSES.—Plans have been prepared for the erection of 28 Council houses at Silverton.

Stirling.—SCHOOL.—The Stirling School Management Committee recommends the Education Authority to build a new primary school in the Shore-road District immediately.

Denbeath.—HALL AND INSTITUTE.—At a meeting of the Miners' Welfare Committee for Fife, Kinross and Clackmannan, held at Dunfermline, plans were approved of a hall and institute at Denbeath, adjoining the ground recently laid out by miners, assisted by the Wemyss Colliery Co., Ltd., as tennis courts and bowling and putting greens. The cost is estimated at £5,000.

Hamilton.—ABATTOIR.—The T.C. is considering the provision of a public abattoir, and a deputation from the Council is making a tour of the best-equipped premises in neighbouring towns.

Airdrie.—MISSION HALL.—The Dean of Guild Court has passed plans submitted by the directors of Airdrie Town Mission for alterations at 22, High-street, known as the Town Mission Hall. The architect is Mr. Bruce Scotland, of Messrs. John Scotland & Sons.

NEW BUILDINGS IN LONDON.

Euston-road.—Mr. Wm. H. Overton, F.S.I., F.S.Arc., of Warnham House, 22, Ship-street, Brighton, is the architect carrying out a new building in Euston-road, Warren-street, and Cleveland-street, and Messrs. James Smith & Sons (Norwood), Ltd., of 106, New Bond-street, W. 1 are the contractors. The building consists of three premises extending from Euston-road into Warren-street, and will probably be used as motor showrooms. The steelwork has been carried out by Messrs. Young & Co., Ltd., of 4–6, Wandsworth-road, Vauxhall Cross, S.W. 8. The pavement lights are being supplied by Messrs. J. A. King & Co., of 181, Queen Victoria-street, E.C. 4. The steel windows are being supplied by Messrs. Henry Hope & Sons, Ltd., of Smethwick, Birmingham.

Whitechapel. — At St. Mary's Station (Whitechapel) on the Underground Railway, Messrs. Kirk & Kirk, of Westminster, are erecting a building to contain public billiard room, with shops and flats over, which will cover the entire area formerly used by the Railway Co. for the purpose of ventilation. Mr. George Coles, of 40, Craven-street, Strand, W.C., is the architect. The steelwork is being carried out by Messrs. A. D. Dawnay & Sons, Ltd., of Steelworks-road, Wandsworth.

Manufacture and Uses of Portland Cement.

A cinematograph exhibition and lecture will be given at the L.C.C. School of Building, Clapham, S.W.4, by Mr. H. K. G. Bamber, F.C.S., M.I.Struct.E., managing director of the Associated Portland Cement Manufacturers, Ltd., on "The Manufacture and Uses of Portland Cement," on October 19, at 7.30 p.m. The chair will be taken by Mr. H. D. Searles-Wood, F.R.I.B.A., Chairman of the Advisory Sub-Committee of the School. Admission will be by ticket, to be obtained on application to the school.

Building Dispute Settled.

A dispute which had threatened to involve a lock-out of 8,000 building operatives in Nottingham and district was settled on Saturday afternoon, after a conference of representatives of master-builders and the men's national organisations. The employers withdrew their notices, upon terms affording a prospect of a permanently satisfactory arrangement.

PATENTS.*

APPLICATIONS PUBLISHED.

194,264.—H. Gronroos: Process for the manufacture of building materials, such as building stone and roofing tiles.

201,852.—C. Webster and H. F. Wernham: Devices for raising and lowering windows.

201,861.—E. Clark: Paving-blocks.

201,867.—A. W. Dickinson: Combined hollow-tile and reinforced-concrete floor and ceiling constructions.

201,650.—Soc. Anon. Prodor and Dr. M. Levy: Manufacture of concrete.

201,952.—E. Hawley: Die-press for moulding or shaping handles and other articles of clay.

202,089.—A. Hart: Fastening devices for windows and doors.

202,092.—W. H. Price: Seat and foot action flushing for sanitary closets.

202,104.—P. G. Tideman: Rotatable apparatus for digging furrows and ditches.

202,112.—G. Whitfield: Furniture and like castors.

202,129.—J. G. Dudley: Cement-coated metal-framed buildings.

202,145.—H. L. Doulton, S. F. Corby and R. J. Pleace: Waste-preventing valves.

202,164.—Clay Cross Co., Ltd., and M. R. K. Bion: Brickmaking machinery.

202,534.—W. M. McNaught: Ridge-roof ventilators.

186,344.—Limousin et Cie: Construction of concrete vaulting for hangars or sheds.

187,956.—H. Treitel and Kammerziegelges: Manufacture of hollow bricks.

199,694.—R. M. Ash: Rubber-faced paving setts and flooring tiles.

202,560.—G. Barden: Nurseries, greenhouses, and market-halls.

202,572.—A. Henderson: Concrete beams, girders, and columns.

Obituary.

The old-established firm of Samuel Wright & Co., Ltd., fibrous plasterers, of whom the founder and managing director, Mr. Samuel Wright, is well-known in building circles, has sustained a severe loss in the death of Mr. Samuel Arthur Wright, eldest son and a director of the company, which occurred at his residence on September 22nd. The late Mr. S. A. Wright had acquired a considerable amount of technical and business experience, having been trained from youth in his father's business, but, unfortunately, owing to a lengthy illness, had been unable for some months past to take a very active part. He will be greatly missed by a large number of friends and business connections.

Mr. W. H. Littler, for many years in business at Hinckley, as a builder, died last week, aged 65.

The death has occurred of Mr. Alfred Davis, builder and contractor of Burnopfield, county Durham. He was aged 72, and "father" of the Tanfield U.D.C.

* **All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.**

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXV.—No. 4211. OCTOBER 19, 1923

LINE OR COLOUR IN ARCHITECTURE.

LL architectural roads lead to Rome. The mediæval styles may be traced back step by step to the city of the Emperors through the Romanesque just as modern manifestations have their origin in the more self-conscious copyings of the Renaissance, hether the outgrowths of Romanesque or of the Re-ıce be examined, the course of evolution has tended in ɔrthern buildings towards the substitution of the line for ass and of shadow for colour.

lready, in the days of ancient Rome, lines of moulding een introduced, together with attached columns and y entablatures used as ornamental features on buildings actual support consisted of piers and arches, but the sting colours of the materials of construction, the great thic shafts of precious marbles or polished granite, the tive sheeting of large surfaces with marble and vivid modified the effect of the superficial mesh of lines. reek simplicity of straightforward constructional ex-n had, indeed, been lost, but the ancient love of colour ed to give a character to both the exterior and the r of Roman buildings that could not have been created ise. Colour was evidently considered to be of the very nportance, and enormous cost must have been incurred vide the masses of porphyry and other precious coloured al, which were carried immense distances over sea and om quarries in remote parts of the Empire.

th the employment of colour as an important element itecture, a tradition as to the disposition of colour masses l to guide the designer, who could hardly fail to learn les of harmony from the multitude of examples which nded him on every side. The arts of decoration and of uction went hand in hand, both well understood and sly put into execution with assured confidence even if ects aimed at might appear to a modern critic somewhat y magnificent rather than expressing the utmost possible ient. The more barbarous and uncertain arts of the esque period retain in their poorer and more meagre this respect for colour, and often where the lack of funds the employment of mouldings and attached columns Roman manner, the large surfaces covered in cloth gs, such as the Bayeaux tapestry, or with designs executed nents, preserved something of the ancient tradition. ements in masoncraft and the invention of ribbed g, however, weighed down the balance in favour of n to lines as distinct from modelled masses or coloured and although traces of pigment are to be found on the najority of untouched medieval works, the love of mouldings gained ground, and for a time overmastered ther consideration.

as with minds filled with the Gothic tradition of ribs nels, of lines of vaulting shafts and label moulds that rthern designers turned to the consideration of the ance of Roman architecture which had been exploited great Italian masters. And here, though the Gothic detail were to be cast off like so much old clothing, the in which the Renaissance came to the north tended t attention to the lines and proportions of Roman ture rather than to its management of colour masses. time Gothic art had run its course the majority of Roman examples of colour decoration which remained round had been subjected to the destructive influences ral centuries of exposure to weather, if not also to ful destruction either as pagan works, unworthy to be d, or for the sake of the value of their materials, and the s of the Renaissance could gain but an imperfect im- of the important place colour had taken in the buildings ey were new. Still less could their diagrams and d drawings, executed in line, convey colour values to rs in the north, who had their attention directed instead inute proportions of the columnar orders as they may be expressed in fractional parts of the diameter of a column. This was arid food for architects, and tended to leave them starving for lack of what should have been a necessary ingredient of their diet.

Colour vanished from the exteriors of buildings, and if it was retained in treatment of interiors it was applied not at the discretion of the architect but at the whim of the painter called in to adorn and finish his work. Even when, as in the case of Michelangelo, painter and architect were one, the architecture tended under this arrangement to become a frame for pictures rather than a living colour scheme; and in the absence of a great master of both arts the question of colour was left more or less to chance. Sir Christopher Wren, that magician in sculptured form, managed to knock some colour sense into the module by marshalling the lights and shadows on the columns and intercolumniations of his portico into key with those on the more distant and more elevated mass of the dome and its encircling peristyle. But after he had painted this gigantic chiaroscuro athwart the sky, and upheld it by half a hundred matchless spires, the colour sense was painstakingly washed out of architecture once more by a return to classical correctness of detail and proportion.

The brothers Adam, Owen Jones, and Butterfield each in their own way, strove to reinstate colour, but their efforts were those of individuals struggling against an overwhelming flood. Ruskin pleaded for colour in architecture, and the last remnants of colour tradition seem to have broken down at his words. It would be well if we could dismiss the subject as ancient history, but unfortunately architecture at the present time has not only to get on as best it may in the absence of adequate instruction, but to combat some pernicious influences of great, if disregarded, strength.

It may be fairly claimed that almost every architectural student is trained in his early years from line diagrams of the orders of classic architecture which fail to indicate the polychromatic decoration applied to ancient buildings. Far worse than this, many students are allowed to work from diagrams which represent one column and a fragment of entablature without reference to the appropriate intercolumniation or to the fact that the colour value of a column is determined by reference to the relative dimensions of the whole assembly of units, the columns and entablature with their proper minor shadows in relation to the main bulk of shadowy intercolumination enclosed in the more brilliantly lighted frame. From the time of the Renaissance to the present day the difference between the colour value of a pilaster and of a column standing free with an ample loggia behind it has been involved in confusion owing to the fact that in an outline elevation such as is put before the student the two things appear identical, although intensely different in actual effect.

The misuse of conventional colours for tinting working drawings to distinguish different materials of construction is another stumbling-block. Truth is sacrificed to an exaggeration purporting to lead to increased legibility and the young architect learns to accustom himself to looking without disgust at collections of the most discordant hues and tones provided in the paint box arranged upon the paper, not in reference to the effect of the resulting pattern, but in accordance with the quality or quantity of certain materials represented. Perhaps the most hopeful sign of a return to a realisation of colour values may be read into the domestic architecture designed and erected since the war under pressure of great economic stringency. Funds have not been available for the many functionless features of pre-war times, and simple, useful shapes have had perforce to be adopted. Under the circumstances architects were driven to consider the possibility of redeeming the plainness of their bare walls and unbroken roofs by the choice of pleasantly coloured materials. It is to be hoped that when the enforced economy has passed the value of colour will not be neglected.

NOTES.

Competition Results.

The letter from a correspondent on the subject of competitions which we publish this week no doubt reflects a large body of opinion as to the desirability of the jury system and the responsibilities of the technical press. Whether it be for our ultimate good or no we can hardly doubt that the jury system of assessing will be on trial before long. As to technical criticism, we have seen it tried with extreme frankness, and the wounds caused thereby have never healed. For our own part we have always aimed to give the utmost publicity to what we think to be the best in every competition, and our recent record shows that we have recognised outstanding quality outside the lists of premiated designs. One might be inclined to suggest that the Holt Line Building Competition, the winning design for which we gave last week, and Sir Edwin Cooper's design this week, would be assessed about as well with the aid of one eminent assessor as with three or four.

Station Architecture.

We have heard so much of the architecture of the small house that we are apt to lose sight of other small buildings, many of which have sunk architecturally to quite as sad a pass as the pre-war house. In buildings such as railway stations there does not exist the stimulus to improvement that the searchlight has provided in respect to housing. One can imagine those in authority at one of the great railway termini, when they hear that a new station is required or that an old one has to be rebuilt, ordering everything to a standardised pattern, including the pressed brick and the curious little spiky fascias that the railwayman seems to love. Let us hope that the new life that is creeping into housing will have its repercussion on the wayside station, and that railway magnates will come to realise that a small railway station might be made a piece of architecture by the exercise of a little thought and little if any additional expenditure.

British Museum Lectures.

The second of these lectures emphasises the absorbing interest of the facts revealed through recent excavations, modifying our views on subjects of the highest importance. The Victorian ideas about "Progress," so complacent in their illusions, have already received a sudden set-back growing out of the threatening experiences of recent years. We are no longer able to assume that kind of progress under which civilisation was found to be so secure, because previous civilisations have entirely disappeared, to be replaced after dark spaces of time by lower ones in the scale of human completeness. And we are also able to see that the collapse of civilisations is not a slow thing: they were not destroyed by slow decay, but by war and fire, coming to swift and disastrous ends. There is a particular significance in this for Europe at the present time which needs no labouring here. Miss Claire Gaudet, in the course of her lecture, gave some very instructive particulars of the method of building construction by the Sumurian civilisation (4000 B.C.). To give elasticity to their buildings they put in courses of reed, mud and bitumen, in their stone or brick buildings, bricks which were plain or convex and unglazed, and the chambers of their houses were grouped round a rectangular court, the mortar being composed of slime (a clay mud) and bitumen. The discovery of the sites of the five antediluvian cities proves the tradition, so long held, that these existed, and which Arab tradition also endorses. At Shiruppak, one of these cities, there are a large number of dry, covered-in wells, brick-lined, and their tops constructed with the earliest form of vaulting known to us.

International Exhibition of Decorative Arts, Monza. (*See p.* 599.)

The Ministry of Transport.

In taking such an important step as that of circularising the County Councils against ugly advertisements, the Ministry of Transport has earned the thanks of all who use our public roads and who desire to preserve the quiet and the beauty of the countryside. Our roads have come recently into very great prominence, owing to the enormous increase in motor traffic. The advertiser, to whom every frequented thoroughfare is a potential hoarding, has not been slow to carry his excesses—his "abominations," as a leader in *The* describes them—far into the co side, his business counting far m his mind than his citizenship. Minister of Transport, in the cou his circular, says that it is "lament that the wayfaring public should b deprived "of the enjoyment public highways should afford," a should like to see among architect other workers in the arts some cor step taken in support of his spirited action. There is a challe decency—let alone beauty—in th cesses to which the Ministry refer. gratifying that a Government depar should have taken this step of circula the County Councils, and we fee that the whole body of disinte public opinion will support any f steps that are necessary to give to their action. For there is a infringement of public rights in claims of commerce to override dominate every other interest tha own. As the smoke of industr has defiled our great cities, so the hoa and its strident advertisements hav defiled our countrysides and towns step which the Ministry of Healt taken will, if the advertiser does not own house in order, before long lead being compelled to do so, and in action they will have the suppo public opinion.

"The Clash of Masterpieces."

Two such eminent pro as *The Times* and have recently denoun different ways the inflicted on a too to public by this "abuse of advertisen The disfigurement of the countrysi hoardings, referred to by the forr a crime of stupidity and blindness

urement of town buildings by letter-atirised by the latter, is a crime of ng, in the sense of too much know- . The tragedy depicted by Mr. ge Morrow is almost too true to life funny. "The young architect puts est work into his design for the Company's new premises," sustained midnight cup of coffee. "He pro- a masterpiece which he hopes will his reputation . . . but the sign- r has his own ideas," and dis- nment is complete. Under modern tions, the design of commercial ngs in some form or other is in- bly one of the main avenues to reputation." Should we be in a on to complain if our young archi- —or old ones either, for that matter— d cease to put their "best work" nything at all, when we permit this drama of the "clash of master- s" so long a run without a protest?

ns on dings. Lettering on buildings can be made a decorative feature; "signs" of a pictorial nature can be valu- dditions to the surface of a building, operly treated; but when either command the death-knell of the ng as architecture begins to . *The Times*, naïvely remarks that the first time that the evil has been ritatively denounced as an evil, and the rights of the public, to whom the roads belong, officially championed." All this is in an admirable cause, but what of the man-in-the-street? Has he no rights and none of that determination? Is it only rural highways that should afford enjoyment? And are there no "wayfarers" in London streets?

Vibration. A serious problem is arising as a result of the extended use of heavy motor vehicles, including the latest type of bus. No doubt under ideal conditions our roads should be capable of carrying such traffic without imparting undue vibration to adjacent structures, but in practice the roads are often allowed to get into a state of ridge and furrow, when the vibration communicated to the neighbouring buildings becomes excessive. The only remedy we can suggest is that increased attention should be paid to the solidity and evenness of surface in city streets, and that we should give up the absurd habit of tearing up the foundations at frequent intervals to arrive at pipes and cables that ought to be placed in accessible underground galleries.

Cinema Notices. We observe in one of the latest and most up-to-date cinemas that the architect's provision of special panels for announcements has not met with the success one might have anticipated; the advertisements have strayed off the panels on to the surrounding pilasters — like patches of fungus. It may be that the panels provided in this particular case are not adequate, but we feel that managers of theatres and cinemas ought to be in a position to know the maximum area that they will require for their notices, and that, when that area is given them, they should stick to it and not spoil the design of the building by going beyond it.

Aerials. The family washing has always been in evidence in the London backyard or garden, and has not added to the beauty of a scene that admittedly had none to spare to begin with. We are now faced with another feature that seems destined to become as universal as the washing—the wireless aerial. The aerials on the Admiralty and on ships are not ugly, but we rather deprecate the extensive use that is now made in the suburban garden of the weedy-looking pole, which totters feebly over as if bowing to the back door. One can count hundreds along any suburban line, not one of which appears to be strong enough for the task imposed upon it, whereas it should be simple enough to fix and support a post that would maintain a dignified posture.

International Exhibition of Decorative Arts, Monza. (*See p.* 599)

GENERAL NEWS.

Appointment.

Mr. L. Doyle, M.S.A., of Leeds, has been selected from seventy applicants as senior architectural assistant for Newcastle. He was for two-and-a-half years an inspector of houses under the Ministry of Health.

The Mayor of Lichfield.

Councillor J. H. Bridgeman, J.P., has accepted the unanimous invitation of the Lichfield City Council to fill the office of Mayor for a second year.

A Builder's Estate.

Mr. Frederick Charles Huins, of Redditch, one of the principals of Messrs. F. C. Huins & Seden, builders and contractors, Redditch, left gross estate of the value of £16,534.

Glasgow Housing Exhibition.

The Housing and Health Exhibition which has been running in the Kelvin Hall during the past fortnight has proved one of the most successful organized by the Corporation. The attendance of visitors has been exceptionally good.

Bristol Square as Motor Park.

The proposal of the City Council to convert Queen-square, Bristol, into a park for motor-cars, and to cut down a number of the fine trees, has aroused the opposition of many citizens. Queen-square is one of the finest Georgian squares in the country, and was at one time the home of the merchant princes of the capital of the West, though now the majority of the fine old houses are occupied by business firms, mostly those connected with shipping. It is five acres in extent.

The Liverpool Architectural Society.

We have received the syllabus of the Liverpool Architectural Society. The principal meetings are as follows:—October 23: Mr. A. N. Shelley, M.A., B.C.L., on "The Control of Buildings by By-laws and other Forms of Local Regulation." November 20: Mr. Ernest C. Bewlay, F.R.I.B.A., on "Outdoor Sketching." December 4: Mr. Herbert A. Welch, A.R.I.B.A., on "Our Clients and Ourselves— and Possibly Other Thoughts." January 8, 1924: Mr. Theodore Fyfe, F.R.I.B.A., on "The Study of the Past." January 22: Mr. F. X. Velarde on "A Student in Paris." February 5: Professor T. H. Hughes, A.R.I.B.A., on "The Monumental Architecture of France" (lantern slides). February 19: Mr. Leonard Barnish on "Birkenhead" (lantern slides). March 6: Mr. W. Milburn, Jun., A.R.I.B.A., on "Hospitals." March 18: Mr. Lionel Budden, M.A., A.R.I.B.A., on "The Relation of Architecture to the Arts."

A Corridor at the International Exhibition of Decorative Arts, Monza. (*See p.* 599.)

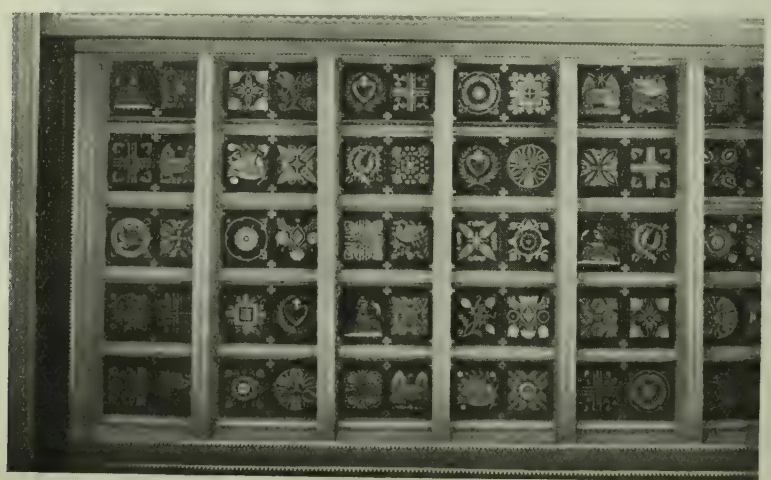
The Surveyors' Institution.

Draft Rating and Valuation Bill.—The Minister of Health, having invited the Council to consider the proposed amendments in the existing law and practice of rating contained in this Bill, and to lay their views before him, the Council has set up a Special Committee, representative of the different branches of the profession more directly concerned, to report thereon. The Executives of the County Branches in England and Wales have also been asked to examine the provisions of the Bill, and to forward their observations in time for consideration by the Special Committee before that body completes its report. The Council hopes to be in a position to forward a memorandum on the Draft Bill to the Minister before the end of the year.

Annual Country Meeting.—The Council has accepted an invitation from the Sussex Branch to hold the next annual country meeting of the Institution in their district.

Institution Reception.—The Council has decided to revert to the custom, which obtained prior to the war, of holding an annual reception.

Annual Conference of County Branches.—The date of the annual conference between the Council and the Chairman and Hon. Secretaries of County Branches has been fixed for February 11.



Annual Dinner.—The annual dinner of Institution will be held at the Connaught R W.C.2, on April 8.

The London County Hall.

The unique system of ventilating the Council Chamber was described by M P. M. B. Grenville and T. Moodie, M.I.Me at the autumnal meeting of the Institut Heating and Ventilating Engineers in paper entitled "The London County Plant, Facts, Figures and Reflections." is partly obtained by a system of trunking the Council Chamber, providing an indi supply to each seat. Besides the main special registers are so arranged to ever that each member can direct the incomi either towards himself or vertically out range. The plant is capable of delivering cubic feet per hour for every occupant chamber.

The apparatus consists of a humidifier, h batteries, automatically controlled fror chamber itself, fans and ice tanks for c The paper commenced with the history section of the plant from the time Mr. the architect, won the open competition in including the provision made for warmin portion of the building completed whe war intervened and stopped the work, ar Government took it over for the use Ministry of Food.

A complete description, illustrated by l slides, of the whole of the equipment was The main building is heated by means of circulation of hot-water to over two tho radiators, having a total heating surfa 68,349 square feet. The hot-water supp over eight hundred lavatory basins and is capable of providing 71,400 gallons water in one hour.

IIBITION OF DECORA-VE ARTS AT MONZA.

irst International Exhibition of Decora-ts at Monza, of which we have already preliminary notice, has proved to be by the fine results achieved. The is to have a series of biennial exhibitions, ing with those of the city of Venice; way in which it has been carried through mmer by the Committee, with an c Director-General, the Onor. Guido oni, and Sig. Rafaelle Calzini as his y, promises well for the future, if the standard can be kept up and even d. especially in the countries coming thout Italy. The *locale* of the, exhibi-the beautiful Villa Reale of Monza, Piermarini in the eighteenth century, ly an immense palace rather than villa, park stretching for miles, and the whole cessible from Milan, is itself a valuable the Exhibition.

talian provinces which took part in the on were Lombardy, Piedmont, Tuscany, re Venezie"—including Venice herself Veneto—Trieste, Bergamo, Volterra alabaster, Faenza with her majolica, a feature also of the Roman section, and lastly Sardinia and the Abruzzi eir interesting peasant arts. Besides ere were special displays of individual such as the attractive "Mostra del installed in the library of the palace ueen Margherita had formerly arranged, ving the book in its features of artistic tiful printing, binding and illustration; in as the "Sala della Mensa," giving rdering of the table in fine glass, linen amics; and a limited but choicely display of the goldsmith's and jeweller's stly, among these separate shows was ay of sacred art, and a display of the decorative work of that fine northern craftsman, Hans Lerche, who had made his home in Italy. Lerche—who had been a pupil of Eugene Carriere at Paris, and who died at Rome in 1920—had made a special study of glass work, but also worked at ceramics, bronze figures, and every side of decorative art. He was an innovator in touch with all that was most alive in modern creation, including the Japanese, and his place in the exhibition was fully justified and a worthy homage to a great modern craftsman.

The idea in the Piedmont room at the Exhibition was to show the home which might be that of a man of artistic tastes and interests. Passing through an entrance hall or vestibule with a fountain, the dining-room was entered, then a studio or work-room, a delightful music room with panels by Reviglione, the billiard room, bedrooms, and children's room, and finally a little gallery.

In regard to the foreign sections it was a matter for regret that England was not fully represented in decorative art, for as one saw last spring at Burlington House, we have a rich field in furniture and arts and crafts. The collection of posters shown in the vestibule had merit in many cases, but obviously did not represent the Empire in decoration. The financial side presented difficulties no doubt, but when we find France, Belgium, Sweden, Bohemia and even Hungary coming forward we may surely hope that on the next occasion some better effort will be made by our own country.

From the decorative side the Hungarian section was most original and interesting, and, of course, Czecho-Slovakia showed well in her traditional industry of glass which, we believe, preceded in order of time even that of Venice, who showed some beautiful glass work. The French rooms were good in sculpture and quality of design, and Belgium gave attention to the theatre in a display of theatrical "maquettes." In a room near this the Futurists, given a free hand as to their choice of subjects, saw their opportunity and took it, with astonishing results. Excellent though this first Monza Decorative Exhibition has proved, what it needs in the future is careful choice, quality rather than quantity in the exhibits, and above all careful and complete organisation on the business side. It might then become a potent aid in the re-establishment of harassed and broken trade throughout Europe and the world, which is what all sane people are working and hoping for.

R.I.B.A. Premises.

It was hoped to complete the rebuilding of the R.I.B.A. Galleries and other alterations before the opening of the Session, but unforeseen difficulties have arisen which will delay the completion until the end of December. Arrangements are being made for holding the examinations in November and December at other premises.——Through the generous hospitality of the Royal Society of Medicine, the R.I.B.A. general meetings in November and December will be held in the Barnes Hall of the Royal Society of Medicine, 1, Wimpole-street, W. 1. Members are particularly requested to note the address.——The inaugural meeting, which will be opened by the President's Address, will be held at the Royal Society of Medicine, at 8.30 p.m., on Monday, November 5. On this occasion, the portrait of Mr. Paul Waterhouse (Past President), which has been painted by Sir William Orpen, R.A., will be unveiled and presented to the Royal Institute; and the Medal for the year 1922, which was awarded to Mr. W. Curtis Green, A.R.A., for Wolseley House, Piccadilly, will be presented to Mr. Green.

A Room at the International Exhibition of Decorative Arts, Monza.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Architectural Competitions.

Sir,—From the interesting correspondence that has taken place in your columns on the subject of architectural competitions, it seems clear that there is a large consensus of opinion in favour of the jury system; at least, if one may judge from the letters you have published, for no arguments against have been put forward.

It was good to see that the opinions of such leaders of the profession as Mr. Lanchester, Mr. Davis, Mr. Atkinson, or Professor Reilly were no less emphatic than those of the younger men; and the conclusion one draws is that this is a reform that might easily be effected at once. I hope that the subject will be brought up at the R.I.B.A. this autumn by one of these gentlemen. Whoever does so will be doing a great service to his fellows and may be sure of their enthusiastic and immediate support.

It seems to me, however, that in this matter, Sir, the technical press has a certain amount of responsibility, which it has held a little too lightly of late. In the first place, one expects enlightened and authoritative criticism. The critic of to-day should have the right to judge the work submitted in public competitions by a high standard, and if he finds that this standard has not been reached in some of the premiated designs, it is his duty to say so. He should be an impartial onlooker, holding a brief for the whole profession; and he, as well as the asssesor, has the right to judge, suggest, applaud or reprove, as may be necessary. Such criticisms as are so often seen to-day, and which consist of little else but some pleasant and soothing praise for the winners, and a kind word for everybody, are totally without value, and a betrayal of trust on the part of the critic.

I would like to suggest that it is only the technical press that can undertake this duty, and that the journal that does so honestly and fearlessly will gain in esteem and prestige.

As a corollary to this, only work of good quality should, as far as is possible, be illustrated. It should not be necessary always to devote the entire space that is available for the illustration of any particular competition to the premiated designs alone, to the exclusion of other designs of probably equal, or maybe greater, interest. It may be that there has been a design submitted of unusual imaginative quality and which would therefore be unlikely to be premiated; I think everyone would be keen to see it, and would rather see it than the sections or side elevations of the successful designs, for instance, if they had to make a choice. Before the war practically all designs of interest were illustrated in some way in the text, if not on separate plates, and this was particularly the policy of *The Builder*.

What I want to emphasise is that architects want to feel sure that they will see sooner or later in your columns all the best designs sent in for any competition, so that they may judge for themselves on what is being done at the time.

London. V. O. Rees.

[**** We comment on this letter in our "Notes" pages.—Ed.]

Field Gates.

Sir,—As a lover of our English countryside I was more than delighted with Mr. Lethaby's sketches in your issue of July 6. The farm cart, as described and illustrated by your contributor, has been a joy to me "since these arms had seven years pith," and the perfect field gate—alas, how rare!—will stir me to my innermost depths. I am neither a builder, an artist, nor an architect; neither can I claim to being more than a mere amateur carpenter. But I know the "right gate" when I see it, and I see it in Mr. Lethaby's sketch No. 8.

Whilst on a summer holiday this year in Brittany I saw a series of gates new to me and which may prove of interest to some of your readers. I only saw them on one stretch of road between Dol and Pontorson, betwixt Brittany and Normandy, but can quite imagine they are common enough in that countryside. Being but one of a party of motorists, with Mont St. Michel as an outward objective, and dinner as a homeward one, I had not sufficient courage to stop the char-a-banc and make a photographic record or accurate pencil sketch of one of these, to my mind, perfect gates. However, I think my sketch (*see p.* 601), after memorising the 20 or more I saw, will convey the idea even if not drawn accurately to scale. I may say at once that it is constructed from the wood of the near countryside and is entirely without metal in its composition.

The outstanding feature is the top rail (A), which consists of a small tree trunk—and often not very small at that—generally, but not necessarily, roughly squared and with the heavy butt end left on, sometimes with the rough and picturesque roots as dug from the ground still intact. This butt end is, of course, the crux of the whole construction, acting as a counterbalance to the barred portion or gate proper.

B is a stout and well-sunk post rather loosely dowelled into the top rail (A), just sufficiently loose to allow of a little upward and downward play in addition to the lateral movement of the top bar. A dismantled gate luckily furnished me with this detail.

C is a post with crutch top in which the top bar comfortably rests when the gate is closed.

When closed and at rest the bottom of gate is just clear of the ground. As the butt end nearly balances the remainder, it requires but a pound or two of hand power to lift the top rail from the crutch and the gate rests comfortably and securely on the ground, wherever placed, either inside or outside of the field. Obviously there must be free play for the counterbalance above the low hedge, wall or bank.

There is nothing, apart from natural decay, to put this gate out of order. The slightest sagging of the hinge post of the ordinary English gate puts it out of gear at the hasp end and, when opened, how often it digs its bulky weight into mother earth half-way between open and close. I have used bad words to the decrepit English "five-bar" after reading the polite legend, "Please shut this gate." Recently returning from the politest of countries, I raise my hat to the Norman-Breton gate.

Upminster. A. E. Reveirs-Hopkins.

The Old Court House, Barking.

Sir,—Some twenty years ago the ancient mediæval Parliament House at York, constructed entirely in the most sturdy yet graceful style of solid oaken architecture, having to be demolished to extend a street, was purchased by a resident of that city, who had every timber carefully taken apart and numbered, with a view to a re-erection of this priceless building in the Minster yard as a Church House—an ideal destiny. Unfortunately, instead of the materials being immediately transported to the new site and at once put together, they were loosely stored in a shed, where they have remained ever since, and as the intending preserver of them is now deceased, it seems very problematical whether this masterpiece of Gothic art at its very best period will ever be reconstituted in its pristine beauty, with its exquisite carvings and perfect outlines.

The same fate seemingly threatens another similarly precious, though less elaborate, historic monument, the Elizabethan Court House at Barking, which was most wantonly and needlessly taken down a few weeks ago, although it was no obstruction to the street, which was wider at that point than any other part, and could have been adapted and utilised for many public purposes. It was also in absolutely perfect preservation, with the exception of one point where, through gross carelessness, a gutter-pipe from the roof, not having any outlet to a proper drain, had undermined the foundation, causing the roof to sag slightly, but this could easily have been set right and the whole building put in complete repair for the small outlay of about £200, which indeed the Society for the Protection of Ancient Buildings had collected, but was refused by the Council! The ostensible reason was t the structure as a pavilion in the par here again, instead of the new fo being previously prepared, so that thes timbers could be directly set up without for double cartage, they also were ready numbered, promiscuously heaped where, unless very promptly put togeth their exact positions may be probabl memory and their delicate and skilful construction forgotten.

In any case, there is no hope of the r being executed in the firm yet con method of the original construction, w so carefully put together that scarcel had started, while the roof, so far fr of the flimsy kind we know now, required saws, axes and crowbars to w tear it apart.

The sight of this splendid but unp old landmark being thus ruthlessly ha shattered was a heart-breaking one to inhabitants, only slightly modulated assurance that it was to be thoroughly and renovated in the Park, a long wa familiar and most useful position, bu now it only depends upon a chance v Council whether the now much- expense of re-erection will be sanctio quite possible that this may be indefinitely or abandoned altogether, one of the most stupid and unnecessa of vandalism that have ever taken plac perpetrated. It even appears that th Party in the council are opposed to th thus proving that they are not only u of their noble heritage in this inimitab but of the opportunity of varied and work it offers, which at least one wo they might welcome.

If the Whitgift Hospital could b though every utilitarian consideration d its destruction, surely this far more example of an architecture that can n revived nor imitated should be spare there was absolutely no serious practic tion, and even the expenses provided.

Croydon. Evacustes A. P

Information on Current Town Pla

Sir,—I was very interested to read Notes that the Northern Division of th Planning Institute is trying to give help to town planners. Institutes g I am told, only develop marked interes members when their subscriptions overdue. It is most difficult usual working on a town-planning scheme to practical data. Half a dozen may be over exactly the same problem, when a information would save a great deal o besides providing a means of obtaining solution.

I have often thought that if practic tions were put periodically to those i of schemes, and the results entered up accessible form by some known person, be applied to by those in difficulty. of preparing schemes, for instance, c kept in relation to areas, &c., methods o with compensation or betterment, the po of concessions, &c. Such a centre of info would be of great use, and probably a would be obtainable from it promptly would cut out, say, six months' corresp with the Ministry.

Manchester. Fiat

The Art of Plumbing.

A correspondent, signing himself sends us an account of a scheme of pl carried out in one room, 97 ft. long an wide, containing 144 wash-basins and 5 In the room there are nearly 4,000 ft. pipe (exclusive of iron), with 1,700 wipe on from 6 in. to ½ in. pipe. He sugges the whole scheme is a work of art and an tion to the student, and would like to any similar scheme that has been carri on a larger scale.

THE DEVELOPMENT OF CITIES.

Principal of the University of Birming-
r. C. Grant Robertson, M.A., C.B.O.,
at an inaugural lecture given at the
ity of Birmingham by Mr. Raymond
F.R.I.B.A., on October 9, on "The
s Past and its Future Form," and in
ing remarks referred to the gratitude
he University felt to the late Mr.
Cadbury and the Bournville Village
or the generosity which had enabled
arrange for the building of town-
and civic design and for the public
connected with it.

e course of his lecture Mr. Unwin,
me remarks on the development of
the past, said general experience in
, where high buildings had been
and where increased road surfaces
n provided, seemed to suggest that
any, advantage was gained by trying
d upwards. Broadly speaking, New
d London were centres of equal popu-
umbering between eight and nine mil-
each case. The average height of
s in New York, although the actual
ers were confined to comparatively
reas, was much greater than in
The number and width of streets
e for carrying the traffic was also
rger. And yet the congestion in the
ork streets was greater than in
; the time that was occupied in getting
rom place to place in the town ap-
to be no less; while the distances
ust be travelled and the time which
occupied to reach suburban dwellings
l to show no compensating advantage
ult of the increased average height and
on of buildings. The disadvantages of
ldings had been so fully recognised in
in recent years that zoning regula-
niting the heights were being adopted
e cities with increasing rapidity.

was true in regard to the overcrowd-
ndividual dwellings or buildings upon
l, or to the piling of stories upon the
, was equally true of the undue crowd-
ther of the different parts of the town.
by mere external accretion must lead
ciency in connection with anything
ad even so much definite organisation
dern town.

nefficiency not only affected the daily
of industry and commerce, but in-
normous waste of capital expenditure.
o the growth of the town by hap-
accretion on the circumference, the
rea was constantly being hemmed in
side, so that no part could grow
t the expense of some other part.
opulation in a town increased, every
central function of the town must expand also. Hence it was that one of the most characteristic sights in certain areas of modern towns was the pulling down of buildings still serviceable for the purpose for which they were erected, in order to make room for the expansion of commerce, wholesale or retail trade, industry, or whatever at the moment might be needing to expand. Over a further large area of the town, where the pressure for expansion had not yet caused so much difficulty as to justify the cost of scrapping the old buildings, efficiency was reduced by the makeshift use for new purposes of buildings which were erected for totally different ones.

From the present method of haphazard growth a disorderly muddle of industrial, commercial, and residential areas or buildings inevitably resulted. As further accretions developed on the outside, many of the advantages which led to the selection of particular sites were taken away. In the built-up area of each large town there ensued a continuous struggle of the different parts to re-sort themselves on some more rational basis; and every move was accompanied by the sacrifice of something which had gone before.

Overcrowding solved no problems; in whatever form adopted it created new difficulties; that was the first lesson.

The second was that in essence the problem to be handled was one of distribution and localisation; the proper distribution of the parts of the town in relation to each other and to the site, and the localisation as far as possible of the life of the people in each part.

In existing towns the disentanglement of the confusion of parts and buildings which had resulted from haphazard growth must take time; but that proper distribution of parts must underlay all planning if it were to be on right lines. Better distribution and greater localisation of life offered the only solution of the present traffic problems. It had become evident that there was no solution to be reached by merely multiplying facilities; each in turn was liable to increase the congestion by bringing people to the centre, as much as it relieved it by taking them out, was liable merely to increase the volume of movement. Bad distribution simply meant that things were in wrong places. A large proportion of the different sections of the town, and many of the buildings which gave rise to heavy transportations, being in the wrong places, much of the congestion of traffic was entirely due to the unnecessary moving to and fro of goods and people which resulted.

The volume of traffic in large towns would be great in any case; but it could be reduced by good distribution, by decentralisation, and by localising the life of the people in each decentralised unit. There would still be need to study carefully the many new methods of transportation now available, and using each for the kind of service for which it was best adapted, to frame the whole scheme to give adequate facilities for such movement of men and things as might prove to be necessary or desirable. So long, however, as towns were permitted to spread out indefinitely over the surrounding territory in a dense mass of streets and buildings, industrial, commercial, and residential parts indiscriminately mixed up and packed together, so long must life in towns be one vast disordered confusion of people rushing backwards and forwards over the whole area, impeded by the congestion which resulted from this cross transport of men and things.

The third principle concerned the method of expansion; for the growth of towns by irregular accretions on the circumference there must be substituted a system of development by definitely organised and complete units, to each of which should be allotted space for expansion up to a reasonable limit. It must be recognised that definite organisation implied limitation. Healthy organisms did not grow by the indefinite inflation of their own bodies, but by becoming the parents of new and younger organisms.

The great towns must be disentangled and organised as a group of definite parts, and in so far as they continued to grow that must not be by mere accretion, but by the addition of new satellite parts, industrial or dormitory suburbs, complete satellite towns, or garden cities, each having its allotted area for expansion and its reserved belt of open space to limit and define it.

The fourth principle was that open space was an essential ingredient of every town, or part of a town. Those sections of the private and public life of the community which depended on adequate buildings; they could not be sacrificed to the undue expansion of the other constituent parts—streets, buildings, or what not—without destroying the completeness of the unit and crippling the efficiency of the city.

The scope of the town planner's work had been expanding stage by stage, from the planning of the simple site or street, until he now had to regard the whole town as an expending organisation for which he must lay out a suitable home. That involved a study of the economic and social principles, which must determine the proper distribution of the parts of the town, and fix the limits within which that distribution could be guided into the form desired; for it was the form of the whole town which in the future must be defined if great aggregations of population were to be able to build beautiful cities and live beautifully in them.

The city plan must be a definite design: no mere mix-up of country and town, garden and buildings. Such a compound, brought about by the extravagant scattering of buildings on the land, must destroy the character of both town and country. There was a beauty of town dependent on the proper grouping of the buildings, and there was a beauty of open space, of fields, woods, or gardens. Design consisted not in mixing of these together, but in bringing them into proper relations, so that each might enhance the beauty of the other, and combining them into a still larger unity.

Much of the most important work of town planning must depend on the knowledge and judgment of the sociologist, the surveyor, the valuer, the economist, the sanitarian, or the engineer, but the result of all their work must finally be embodied in a plan; that plan, if successful, must reveal a definite design, and could only be made by an architect or a town planner who was a trained designer: one whose imagination had been cultivated in the art of creating out of a mass of details a unified design, bringing them all into proper proportion and relation.

A French Farm Gate.
(See letter on previous page.)

THE SOCIETY OF ARCHITECTS.

Election of Officers and Victory Scholarship Awards.

Mr. E. J. Partridge, F.S.I., presided over a special general meeting of the Society of Architects, on Thursday evening last week, when the officers and council were elected for the ensuing year and the Victory Scholarship Prizes were distributed, while Mr. Arthur Davis, F.R.I.B.A., on behalf of the jury of assessors, gave criticisms of the designs.

The following officers were re-elected *en bloc*: President, Mr. E. J. Partridge; past presidents, Messrs. E. J. Hamilton, E. C. P. Monson, A. E. Piedmore, E. J. Sadgrove, P. B. Tubbs; vice-presidents, Major C. F. Skipper, Messrs. L. S. Sullivan, A. J. Taylor, T. Wallis; hon. secretary, Mr. N. D. Sheffield; hon. treasurer, Mr. W. G. Ingram; hon. librarian, Mr. G. B. Tubbs.

The Council is constituted as follows:—London—Fellows remaining in office: Messrs. H. C. H. Monson, C. F. Norman, F. T. Verity, E. Marsland, J. H. Pearson, and T. Davidson. Three Fellows elected: Messrs. H. Freyberg, F. C. Moscrop-Young, T. S. Vickery. London members remaining in office: Messrs. T. G. Angell, T. S. Darbyshire, F. G. M. Chancellor, H. M. Robertson. Elected: Messrs. A. B. Hayward and H. R. Sayer. Licentiate: Mr. S. V. Bradford. Country—Fellows remaining in office: Messrs. H. Gill and G. C. Vernon-Inkpen. Elected: Mr. T. T. Rees. Members remaining in office: Messrs. E. J. Williams and J. Knight. Member elected: Mr. H. W. Smith. Licentiate elected: Mr. J. H. Lye.

On the motion of the President, a hearty vote of thanks was accorded the scrutineers in the election of the Council.

The President then handed to Mr. B. M. Flegg, the winner of the Victory Scholarship, a cheque for £100, and a gold medal. The following other competitors were each awarded a cheque for £5:—Messrs. F. Scarlett, D. F. Martin-Smith, J. C. Shepherd, R. H. Brentnall, A. J. Saise, J. A. Coia, and S. Bradley.

Mr. Arthur Davis, before giving his criticisms of the designs, which were for a hydropathic establishment, read the programme for the competitors and the principal features to be considered, as follows:—(1) Site is on an incline; (2) the special character of the building and garden lay-out; (3) the building would probably be erected by a local municipality or a company, and therefore should not be of such a costly nature as to jeopardise the commercial prosperity of the establishment; (4) it would be used not only for hydropathic and medicinal purposes, but should be a semi-pleasure resort; (5) a valley is mentioned in the programme, therefore the question of outlook and aspect should be carefully considered, and all the principal terraces, porticoes, and sitting-out places should be planned to obtain good views; (6) the buildings should be effective as a climax and background to the trees and foliage designs of the surrounding gardens, and should form a fitting architectural setting to the entire composition; (7) any formal garden treatment and all secondary buildings should be grouped in an economical way so as to give the maximum effect, which always occurs when a sloping site is being dealt with; (8) the programme demands that the men's and women's baths should be treated in separate compartments, but this would only apply to the baths themselves, and the public rooms, and especially the terraces, gardens, &c., should be enjoyed in common.

Mr. Davis observed that the scheme of a hydropathic establishment was not a kind of theoretical scheme in the air, but was a type of establishment that was being constantly demanded, and such buildings were being put up in Austria and France and other parts of the Continent. On the whole he thought this year's competition rather disappointing compared with the previous year, and the jury of assessors thought that the schemes submitted were not so good as they might have been. In most of the designs sent in the features mentioned in the programme had only been partially carried out, and in some cases they had been ignored. He pointed out that when, as in the present scheme, they were building on a hillside they had to deal with the effects of the elements in a more careful way, and the upkeep of the masonry and roads was far greater than when one was building on the flat. This was another point the competitors had failed to observe, and the consequence was their designs would never make for a paying proposition. A hydropathic establishment should also be a kind of pleasure resort and have the character of a casino, but he had not seen one elevation that fulfilled these conditions. Many of the competitors had also failed to put the windows in a position to ensure a good view of the beautiful valley below.

The winning design had a great deal of merit, but there were faults. It was considered a very simple and straightforward attempt to solve the problem; the general lay-out was good, and with that design a fine view could be obtained on the sloping site without great cost. The winner had planned his treatment and dressing rooms side by side, which was good. His principal fault was in the arrangement of the terrace, which had been divided by the recreation room.

On the motion of Mr. H. V. Lanchester, seconded by Mr. L. S. Sullivan, a hearty vote of thanks was accorded Mr. Davis for the criticisms.

EXHIBITION NOTES.

BURLINGTON HOUSE "PRIMITIVES."

In spite of the considerable interest in the work shown, what we had foreseen in such an exhibition as likely to happen has affected the critics also, some of whom find it a little depressing. As a writer in the *Evening Standard* says: "The fact remains that we had no Cimabue, no Van Eycks; and it will be mournful for newly-returned travellers to go to Burlington House"—those in fact who have their minds coloured by Italian memories. We felt at the time of the inception of such an exhibition that Lord Lee of Fareham showed more patriotic zeal than judgment in proposing such a scheme, because likely to lead to an inference not strengthening to the claims of English mediæval art, while at the same time it could hardly fail to be unjust to it. The relatively small amount of work it was possible to show, seeing that it is neither possible to remove wall paintings or to show much masons' work—which is better seen in its own native setting of the ancient churches and other buildings throughout the country—made it impossible to give any really representative character to the show. Nor is it possible—is it even so very important?—to be so anxious to prove the native character of the work. A well-meaning patriotic propagandism, no doubt, but not so important as other more intrinsic considerations. While it is not possible to determine the exact amount, we know that English mediæval art was subject to strong Continental influences, and that, like the Eton wall paintings, was probably the work of Flemish artists in many cases, but this need not concern us so much as the genuine beauty of its character. It is, perhaps, in the work of the mason and in woodwork that the English work is so supreme—but such an exhibition will convey but a poor idea of this. We can recall work done in Suffolk churches alone which establishes the highest claims for our native genius, but obviously this cannot be seen in galleries.

INSTITUTE OF OIL PAINTERS.

Once again the pleasant galleries of the Institute of Oil Painters offer an attractive show of well-displayed pictures, amongst which are many which make a vivacious appeal, as the airy grace of Anna Pavlova, by Sir John Lavery (348). This picture is painted in a light key of colour, warm greys and red, and is lightly handled, so that the dainty poise of the dancer is tellingly accentuated. After all, this treatment is pleasant and harmonious, for we do not want a heavily painted and dignified picture fairy-like a creature as Anna Pavlova. A ing panel picture of a child, "Angela (340), by Isaac Cohen, shows a signal in of the possibilities of colour value in a palette. The clever painting of "The Spades" (356), by Fred Leist, forcible and pelling as it is, would hardly outlast the of a less strident note. The charming s by the Hon. John Collier, painted with ap truth and reserve, loses in value for lac better colour scheme. The portrait of jynin (380), by Geo. J. Coates, is admira colour and drawing. Two or three portra R. G. Eves, "Marjorie" (135), by Inglis Sh Williams, and other figure subjects are noting. In landscape work the exhibit unusually interesting. We have quiet, meadows with a soft, tranquil handling pleasing in Alfonso Toft's "Missenden" several minor pieces of quality like "The Moon" (357), by C. Ross Burnett, and pi like 294, 329, 350, 121, 127, 106, 101, 15 59, which are lifted well above the common Leonard Richmond, Terrick Williams, Olsson, Davis Richter, Anna Airy, John R. Sir Wm. Orpen, and others have contribu place the level of attainment above the The extremely clever impression of "Sunl by Sir Wm. Orpen, is not likely to be overlo but even in presence of such great skil cannot help questioning the unfortunate position of the half-nude woman wit reflection.

THE FINE ART SOCIETY.

A number of charming landscapes in toned colour by Henry A. Payne are no view at the Fine Art Society. The passa subtle, refined colour effects in some of water-colours, such as Nos. 22, 23, 13, 4 30 and 27, will give much pleasure to of the quieter aspects of nature. The expr of form and colour in "The Norwegian Fi (23) and the "Strange Hills of Norway" is very pleasing, and most of this artist's dra have a very definite and distinctive Four well-designed gilded and lacquered mi are agreeable items in the exhibition. pictures are well displayed in the new decor setting of these galleries, which are now counted amongst the pleasantest in Lo Upstairs is a collection of cabinet picture members of the Royal British-Colonial So of Artists—the object of the Society is to the Arts of the Dominions, States, and Col of the Empire under the notice of those resi within the United Kingdom—a useful praiseworthy object which in time we may be effected. Meantime, several well-kn names show the authorship of a number of most striking exhibits, such as Miss Ke Welch's "Haymaking on the Downs" "Our Carnival" (43), by T. C. Gotch; bare-boughed trees in "April" (61); by Lamorna Birch, "Stormy Haymaking" (85) the late Claude Hayes, and the charm "Jenny" (16), by G. P. Jacomb-Hood. Ar tecture is represented by good-coloured elevat section and plans of the Grand Staircase, Sk Ball-Bearing Works, Luton, by Sir A. Brun Thomas; a water-colour of a Gloucesters House, by A. N. Prentice (74); photograph "Hatton Park" (54), by H. C. Corlette; attractive drawing, "In Ancient Bretagn (87), by W. E. Riley; "The Old Bridge at A non" (82), by W. H. Y. Titcomb, and Mo Lindner's "Puerte Nuevo Pronda" "The Fringe of a Manx Moorland" (73), Wm. Hoggart, shows a fine spacious eff "The Trees near Bolton Abbey" (32), by Vicat-Cole, is an excellent piece, and a deligh picture is the "Wan Water, Yarrow" by Jas. Paterson. The dainty picture "Early Morning, Venice," (15), by E. Boro Johnson; the rich colour note in Geo. C. Hai "Water Vendor" (14); W. R. Wollen's mast rendering of "A Lonely Watch" (3); and Boy and Dog," by H. S. Tuke, are amongst more notable works in an exhibition which much to show in range and variety of acc plishment.

Design for Office Building, Liverpool, for Messrs. Alfred Holt & Co.

We now have the opportunity of publishing the design submitted by Sir Edwin Cooper in this limited competition.

The promoters of the competition stipulated the positions of entrances, and that the north-east half of the ground floor would be taken up and utilised as a bank, and that one of the upper floors would eventually be allocated to Messrs. Holt's own use. These being the conditions, the problem became one of obtaining as much floor area as possible with good light and ventilation, the floor area being disposed in such a way as to become readily adaptable for any unknown requirements.

The treatment of the design shows the handling one would look for from the author for a building of this character. The total height was suggested in the letter of instructions. The details amplify the elevations and show how a maximum of light can be obtained, especially on the ground floor, without sacrifice of architectural dignity and strength. One internal lighting court has been adopted as the solution affording adequate light for internal rooms upon the lower floors, which should be of the same rental value as those on the exterior of the building.

The design placed first, by Mr. Arnold Thornely, F.R.I.B.A., and Mr. Herbert J. Rowse, A.R.I.B.A., in collaboration, was given in our last issue.

Banque Belge pour l'Etranger, Bishopsgate, E.C.

This drawing illustrates the Banque Belge as erected in Bishopsgate. The scaffolding is now being dispensed with, and the interior is well advanced. The whole of the ground, first, fourth, and fifth floors and the floors under street level are being utilised by the Bank. The building is in Portland stone and the contractors are Messrs. John Mowlem & Co., Ltd.

Sir Edwin Cooper, F.R.I.B.A., is the architect.

Messrs. Spillers' Building, St. Mary Axe, E.C.

This building is now in the course of erection for Messrs. Spillers' Milling and Associated Industries, Ltd., as their office headquarters.

The angle on the ground floor will be utilised as a bank for Messrs. Barclay, the bulk of the remainder of the building being allocated for Messrs. Spillers' own use, with the board room, Chairman, committee, and chiefs on the second floor. The building is of Portland stone, and the contractors are Messrs. Higgs & Hill, Ltd.

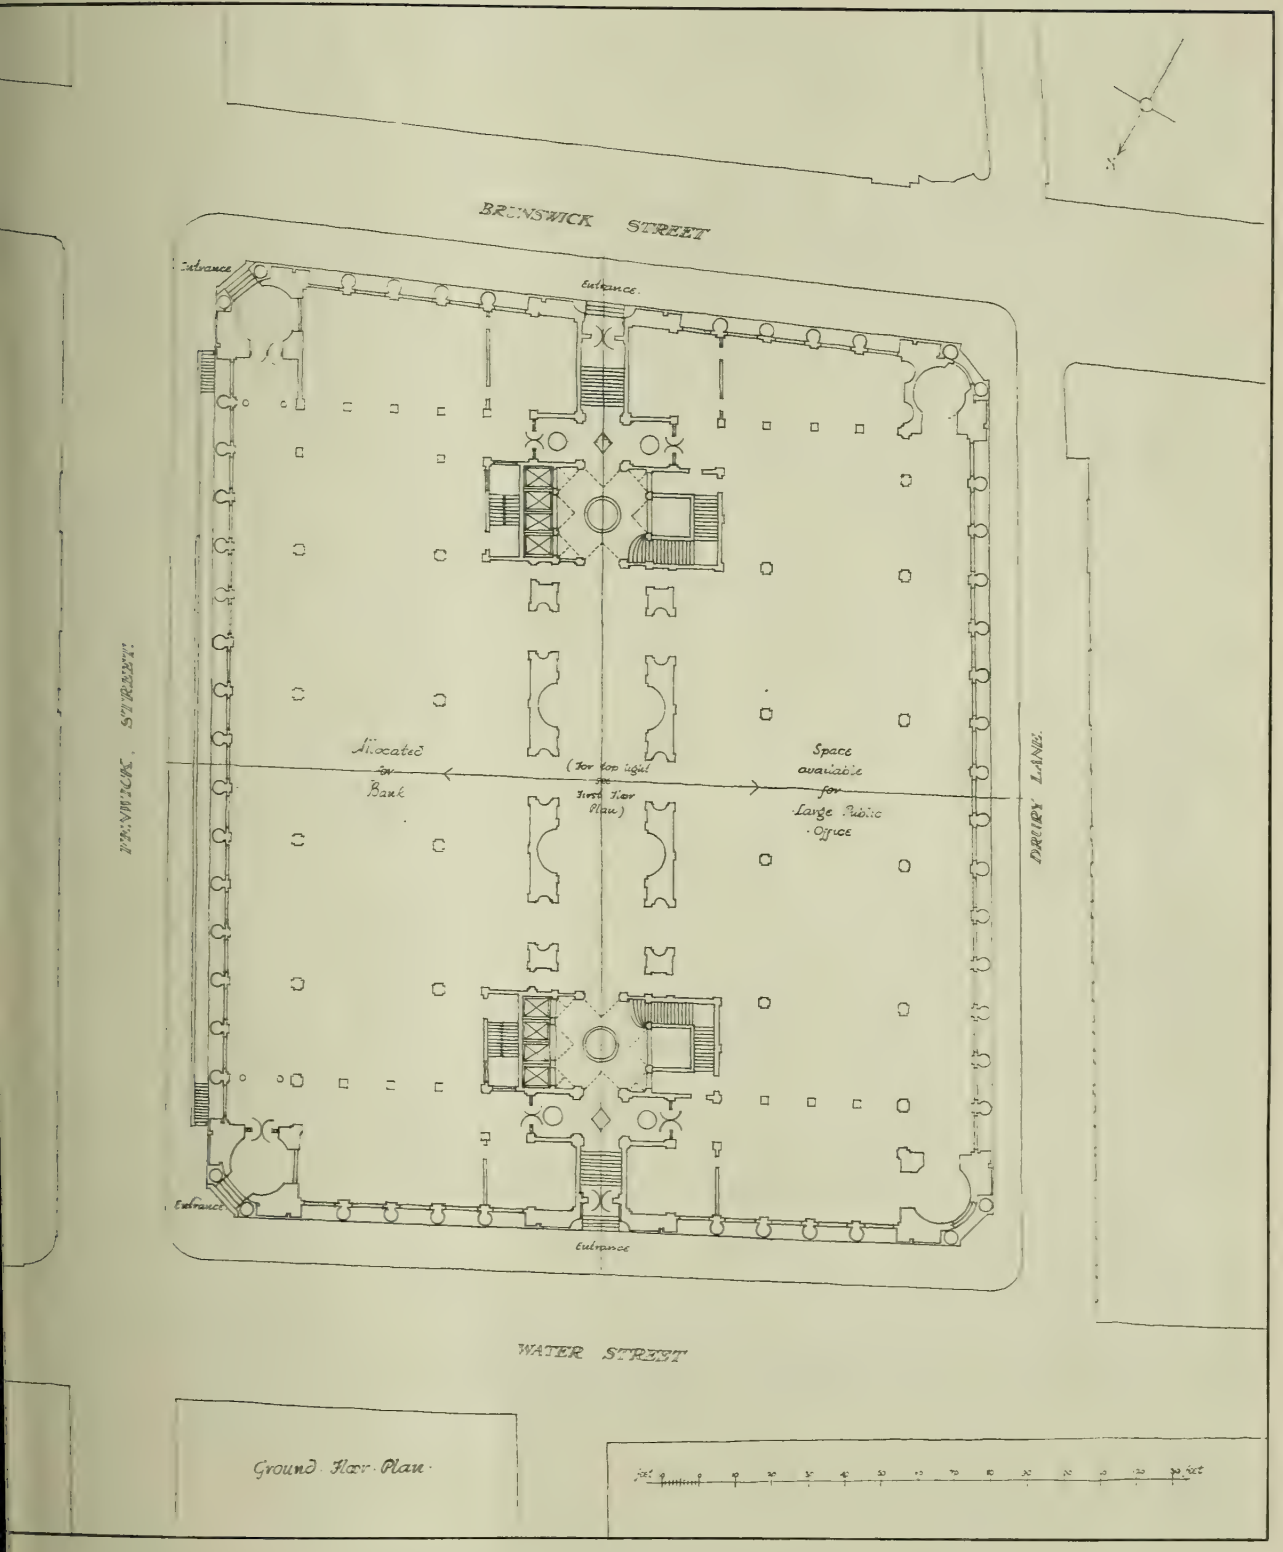
The architect is Sir Edwin Cooper, F.R.I.B.A.

CHURCH FITTINGS.*

The author of the English Parish Church, unfortunately deceased before the present volume under review was completed, has added to his claims as antiquarian and ecclesiologist by the informative character and wide range of what it includes. With a wealth of well-chosen illustrations the book shows so much appreciation and knowledge of the subject that it becomes a necessary possession to all those interested in the wealth of artistic tradition included in the English Church, and can be warmly recommended.

Mr. Aylmer Vallance, in a brief and sympathetic introduction, gives us an illuminating account of the growth and correlation of the various arts of this country, showing how they acted and reacted on each other. He is less happy when enunciating the relation of architecture to the other arts. It is a comparatively modern fallacy which mixes up priority in service with paramount claims, and the shibboleth of the "mistress art" leads him astray. The jewel is not less precious than the casket which encloses it. There is no first or last in art; nor was, we think, architecture in advance of the other arts in the Middle Ages, as stated by the writer. Their strength lay in that they all grew together.

In looking at the variety and beauty of so many of the examples reproduced, admiration is compelled to the humble and aspiring character to be identified with the best of them. But we have also to remember that there is a like claim on our own time for beautiful expression. Nor should the past wrap itself around our life to the exclusion of a self-respect which feels equal to the same endeavour only shaped to our own needs. lead us to forget that the present—as all —holds within it the seed of a po nobility. Anything less is superstition appreciation, and obscures our right u standing, not only of the past, but ours Study these illustrations, fairly comprehe as they are, and representative of the d ent ages illustrated, and we shall fin wards the termination of the fifteenth ce a change occurring—a change in whi included a visible decline both in temper direction. The earlier humble strengt diverted from its dream—from its sp time, and other motives are drawn in Instead of art being a sort of worship expression of the mystery which broods life—the reverence for what was above there is seen the entrance of worldly fluences, of ambition for display and assertion instead of the breath from Divine which cloistered it before. The m ments gradually change their chara Donors appear in the windows. The cr manship remains, but the ideal of servi what is above ourselves is directed elsew until we reach the time when the recum figure rests elegantly on his elbow, that may see more of his earthly likeness— always inspiring—until later the Royal A the hachment, redundant inscriptions to bodies, convey to us the likeness of a dec sion in direction and inspiration under w the ancient noble spirit becomes buried.



There are critics who will tell us that period must be judged independently; own contribution estimated away altoge from such generalisations as we have n here. Unfortunately for such a view, human question remains, and its claims c pel us to distinguish in what so much aff the well-being of life, which in one case g freedom to it and in the other enslaves The revival of the "Baroque" in Germ preceded the Great War. Full of shal pride and pretension, its contribution was wards the evils which subsequently transpi If we are to shape the world for bet things we must see them as they are, mixing up things or claiming any "rate" for art.

Another consideration occurs in study this book, which has not been sufficien opened out in recent days when consideri the prospects of the crafts. It was the ha of old time to speak of art as a "mystery denoting in this its prevailing value, c which transcended knowledge. The pres pride of knowledge, which governs our craf manship, the attachment to machinery, t almost superstitious belief in the efficacy organisation, diverts us from the appreciati of this intuitive creative quality, which endo all vital craft work. Could we but leave little more to nature, we might understand much better, as not thinking that we did all ourselves. Is it not too readily assum that our schools, methods, and "cra ideals" will do for us what, perhaps, th are in themselves wholly unable to do. b cause it is the life which determines th achievement! It was not the learning these mediæval craftsmen that gave the work its supreme quality, but the life whi nourished it and sheltered it under belie which could hold it secure. We cannot f with their wings—nor can we without o own, nor will the pride of intellect and civ lisation achieve much for us robbed of the in pulse that gave their work its strength. Or is also reminded when looking at these illu trations of their superiority to academ claims. Work is not rude because unrealist in the narrower sense. Representation ma be the meanest kind of veracity, far belo art, and the photograph is a better picture All noble truth is robed in another garmen The volume runs to twenty chapters, includ ing index, and 274 illustrations, and muc credit is due to Messrs. Batsford for it excellent get-up.

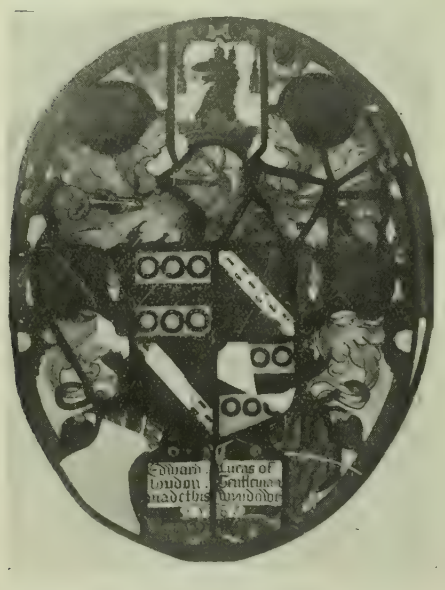
THE ETHICS OF RESTORATION.

By REGINALD HALLWARD.



I THINK it has been a defect of the *intelligentia* of the last decade or two that it has carried its knowledge too solemnly to let in the light of more generous views, and as a consequence knowledge has become darkened by maxims and formulæ, ready at any moment to be flourished in the face of any unhappy individual with the temerity to question them. This has been rather the case in regard to restoration, which, working so much evil in the past, has frightened us into the other extreme of doctrine, which in itself also leads to error.

Until I tried, it was not known to me how very interesting and agreeable was the task of repairing—I dare not say "restoring," word of such horrid significance—a piece of ancient glass. So when a client suggested sending such a piece for me to look at, and the glass itself came to hand—an heraldic glass medallion, evidently authentic, and a fine example of its period (1586), though a good deal damaged, and here and there pieces of the glass absent altogether—the impulse was strong on me to renew its ancient, beautiful completeness if I could. Permission being granted I set to work, and found in it a very interesting interlude from my own work. For it had always been some distress to see those patches of plain matted glass, replacing the lost pieces in an ancient window, which, from the terrible experience of ignorant restorations in the nineteenth century, had superseded it. The absence of the artist in such restoration was so glaring that a better taste rejected all restoration for a purism well meant, but more sincere than satisfactory. The medallion to be repaired (see illustrations) had been releaded about a century ago, and had no doubt been the occasion of the repair of a bad break in one of the larger pieces of glass—the mantling on the right hand side above shield. This repair shows no appreciation of the intention of the lead design, and it will be observed that the releading of the breaks is made with lead of the same thickness as that surrounding the whole piece; whereas, had a narrow or string lead been used, the intention of the lead lines would not have been obscured. However, this was authentic early nineteenth-century repair, and to be left alone, and only where the lead was actually perished or to mend the breaks was new lead introduced.

It is a delicate matter repairing enamel glass of this period, which is very thin. The enamels take the fire better on thin sheet and with less loss of translucency, which I take to be the governing reason for its use. I have made experiments of the use of enamel on thicker glasses which have their own interest and particular quality, to which I hope to refer in a further article; but to return to the medallion, of which the lower left-hand piece of painted glass next to the inscription was missing, as also a piece from the lower right-hand division of the shield, and another small piece elsewhere. I had to decide between renewing the gaps with plain glass, so, as it appears to me, emphasising the loss, or repainting them in the likeness of the original. I had no doubt that all the advantage lay with the latter course. So I painted and fired on thin glass new pieces to correspond with the old, and found it an entirely natural thing to do so. Far from feeling that I was divided by centuries from sharing the impulse of the craftsman who had executed it, or that I was "forging" anything, I entered so much into the spirit of his work, that I might have been him myself! None but those who prefer maxims and formulæ to life can doubt but that the result is much better than if I had only inserted plain glass. History may surely yield to beauty in such a case, for in such an instance the appeal to history has really no meaning.

I am sure that most craftsmen would find a natural delight in so restoring tenderly the work of brother craftsmen on which the hand of time had left its mark, for in spite of all our superstitions there is nothing like the distance between ourselves and them, which some would have us believe. And this later enamel glass treatment, though a subsidiary means, has none the less much attraction for the painter of glass, in its own particular way. Though unsuited for large spaces it has quite its own attractiveness for medallion work, as witnessed in so many instances of its own period, and I often apply it in combination with the ordinary glass painting with metallic oxides, for small details and enrichments, an embroidery to a dress, or flower, I recall the mystification which the introduction of this enamel treatment as an enrichment to an inscription was to a critic, at a loss to understand how I had obtained this particular effect—an effect obtained by the simplest means—though he much approved it. The delicacy of treatment obtainable with enamels makes their use singularly attractive for domestic work, where it is seen near the eye, and its use for domestic work was considerable about two centuries or so ago, and I should like to see some revival of it at the present time. There is much that is agreeable in the conjunction of coloured glasses with enamel colours and they have their own quality, lying in the particular materials used, and at the period of the medallion illustrated here, they introduced a new very delightful quality of their own, of great richness and variety, and it appears better than taking sides on the matter to appreciate this, and not to talk of enamel as denoting the decadence and end of good stained glass, but having its own expression and characteristics.

It is said as an objection to the use of enamel that it does not last well, but throughout the country are still to be seen and giving a very good account of themselves, many medallions dating from the sixteenth century. I do not propose for a moment to press the claims of this enamel treatment against the earlier method, the one I practise myself, but as contributing a further charm when combined in the subordinate way I suggest, it extends the resources of the materials. Raphael painted a masterpiece on the bottom of a tub! With all respect for "craft ideals," and the rather excessive worship of materials, we are perhaps too ready to put the emphasis in the wrong place, and to mistake the means for the end. There are many ways of doing things, more than one for producing beautiful features in glass painting, and we ought not to mistake the means for the end, so much as to suppose it an intelligible proposition to suggest that the use of enamel lead to the destruction of the "art of stained glass." We must look a little deeper than that.

SIXTEENTH-CENTURY ENAMEL GLASS MEDALLION (BEFORE REPAIR).

ADVERTISEMENTS A HIGHWAYS.

THE Ministry of Transport has dra attention of local authorities to the di ment of the countryside by advertis along public highways, and the circular attention to the fact that the new arteria in the area of Greater London are beir disfigured even before the roads are o public traffic, and the Ministry sugges the local authorities should consider w action can be taken under the Advertis Regulation Act, 1907, or otherwise, t guard the amenities of the public hi under their control.

It seems the irony of fate if th arterial roads, themselves destroyin rustic appearance of the country, sho attacked by "lesser fleas," and furth figured by advertisements.

It will be remembered that there wa siderable difficulty in framing satis by-laws under the Regulation of Adv ments Act, 1907, which would prote highways (see *The Builder*, Septemb 1908), but in 1911 the Hampshire County drew up a by-law prohibiting the exhibi advertisements visible from any public way or footway so placed as to disfigu natural beauty of the landscape (see *The B* September 22, 1911). In 1912 the Kent Council framed a by-law on these line somewhat more drastic, as it included ra and any space of land or water open public (see *The Builder*, August 30, 1912

Under the Act, existing hoarding advertisements are exempted from th for five years from the making of the b and this unfortunate provision prevent by-laws taking immediate effect.

We are unable to say whether the Ham and Kentish by-laws have been enforc whether their validity has been impugne they have been upheld the local auth appear to possess the necessary powers i care to exercise them, but if otherwise diate legislation should be passed leg by-laws drawn on these lines.

Decorative Panels at Southampton

THE excellent decorative panels illus on pp. 609 and 610 were executed i Southampton Cinema by Mr. G. R. Ru R.B.A. They are large panels, the ones measuring 16 ft. each way, an others 14 ft. by 9 ft. 6 in. The artis been successful in securing good bread effect, with a pleasing emphasis and d tion of features.

SIXTEENTH-CENTURY ENAMEL GLASS ME LION (AFTER REPAIR).

THE DECORATORS' EXHIBITION.

Decorators' Exhibition, opened at
d Park Hall on Wednesday, Octo-
gains in architectural dignity from its
on axial lines. To avoid crowding at
rance and attract in-comers away from
ors an imposing exhibition stand has
laced where it can be seen by visitors
as they enter the hall from the main
le. The centre of the floor area has
lanned as an open space where the
can gather, and its individual members
k about them, get their bearings, and
great many of the surrounding ex-
in perspective before approaching any
lar one of them. The advantage of
rangement is great in that congestion
ruggling are avoided and the sight-
whether bent upon business or pleasure,
abled to proceed to the inspection of
ibits in an unruffled state of mind.
stands and show-cases surrounding the
space are not designed purposely to
e one another, but the general arrange-
ermits them to appear as units in a
scheme in spite of their individualistic
er. Absolute uniformity is neither de-
nor practicable in an exhibition where
t manufacturers and merchants each
te their own designs, but the assem-
f a series of stalls of approximately
ne height has sufficed to give a sense
ortable enclosure to the central space,
ne selection of the most architecturally
tial stall to occupy the principal
is a notable concession to the archi-
principles of planning which has been
an justified by its success.
nusual degree of consistency also marks the decoration of the building in which the exhibition is being held. The colours —yellow and blue—which appear in the paint-work of the stanchions and girders of the gallery, have been repeated in the festoons of drapery suspended between the tie bars of the iron roof and the valances hanging from the sills of the clerestory windows.

The white, cream, stone colour and light neutral greys that have been used freely as background colours in a great majority of the stalls also help to preserve an air of harmony throughout the whole exhibition. The period of unrestrained jazz effects seems to have passed, and the principal exhibit, designed in free Renaissance style of architecture with columns, arches, and three niches, has been painted modestly in broken white with an egg-shell surface, with a black base, two black panels, and a black line in the cornice to give relief. The colour values of simple architectural features are well brought out in this exhibit, and the plain clean white and black indicate what good things lie in store for us when once the smoke and soot nuisance shall have been abolished.

For exhibition purposes coloured lamps have been arranged to throw pink and green reflections upon the curving surfaces of niche and vault and column with amusing results, and, where the cornice cuts off this rather theatrical glow, two large pink globes supported on vase-like pedestals at the ends of the attic maintain the quality of the light and colour on the upper part of the structure.

Pleasant lighting effects have been arranged in most of the stalls on the indirect and semi-indirect systems and by the use of coloured globes and shades either of frankly Chinese design or of veined alabaster in a fashion that is becoming deservedly popular. These bowls and shades are not only beautiful in themselves, but help to minimise dazzle and eye-strain, and, strangely enough, even the vigorously coloured shades do not detract from the appearance of the coloured exhibits as much as might be expected. The pale alabaster, opal glass, and frosted or fluted glass bowls used with the semi-indirect system actually seem to produce an improvement in the appearance of coloured wall-papers and other strikingly patterned objects, which look better by this pleasant form of artificial light than when seen by the diffused daylight of the hall.

Among individual stalls some which were open and unroofed had the advantage of looking well from the gallery as well as from the floor of the hall. This dual aspect of stall design is receiving attention, and some stall-holders who had roofs over their stands expressed themselves disappointed that they had not thought of the effect when looked at from above, and realised in time that a simple tent-like canopy would suffice to keep the dusty ceiling cloth from becoming an eye-sore before the time comes for its removal. The He-o-lin stand, constructed somewhat after the manner of a small Chinese temple, scores by possessing a roof of yellow material stretched upon curving black enamelled supports, rather like an enormous lamp-shade, which looks bright and interesting from every point of view. Besides being more tidy, this method of finishing the top of a show-stand is more distinctive than the too usual unsightly tray for the collection of paper and cigarette ends, and is, in consequence, a far finer advertisement to the firm employing it. Viewed from the ground floor the simple

anels (14 ft. by 9 ft. 6 in.) at a Cinema at Southampton. Painted by Mr. G. R. Rushton, R.B.A. (See p. 608.)

square lines of Messrs. Sanderson's stand are very effective, and the reposeful effect of the frame with its well designed lettering, not too large in scale, contrasts well and throws into prominence the beautiful patterned wall-papers exhibited in the interior. The stand of Messrs. Blundell, Spence & Co., Ltd., with its woodwork decorated in flat black and gold, is also eminently satisfactory, and their varied exhibit, including both raw materials and examples of work carried out in their well-known petrifying liquid enamel, makes a mass of broken colour that retains its interest even in competition with the more elaborate artistry of the other stalls. It was a happy thought to use dull black Doulton ware pots and bowls to contain the brilliant samples of powdered pigments and the chemical substances from which they are derived, since they carry the colour note of the stand itself into the mass of articles displayed on the counter. The crystals and masses of gum used in the manufacture of enamel and varnish give some suggestion of the labour involved before the crude material can be converted into the reliable finished product ready for the painter's brush. In another stall paint-making machinery actually fitted up and operated by an electric motor carries on the thread of this technical interest. A pug mill grinding up a surging mass of paint in a large steel pan, rollers mixing the paint, and mechanical strainers straining it free from lumps or impurities marks a great advance upon the time when pigments were prepared by a blindfolded donkey walking drearily around a pivot.

An example of the long continuance of an old-fashioned method of manufacture is to be seen in the stall of Mr. G. M. Whiley, where the several processes involved in beating solid gold into English gold leaf are illustrated by specimens to which descriptive labels are attached. The final processes of trimming the gold leaf and placing it between sheets of paper in book form are carried out in the exhibition. The operator's hands must not come into contact with the thin metallic film, and the cutting is performed with sharpened sections of reed fixed in a little frame called a wagon. The finished leaf is lifted with box-wood pincers and gently blown into position in the book. The trimmings are, of course, collected and refined again to melt down once more to solid gold. Machinery is used in the earlier stages of the work, but, for the final beating, experience shows that the hand-work of human experts is necessary.

The manipulative side of decoration is represented in the appliances for cutting and trimming of wall-papers, the brushes and paint sprays, and in the light portable extension ladders and hanging cradles exhibited on various stalls.

The desirability of approaching the surface to be decorated without the erection of a cumbrous scaffold to block out light and i fere with any distant view of the effe obvious, and the many devices by which painter can mount to his work all posse high degree of technical interest. The d of colour decoration enters largely into t of the exhibits. Wall-papers and ste have obviously to be designed before they be executed. Other designs for executio hand in accordance with special method technique are to be seen in some of the where the paint has been made to curiously curdled forms by adroit han and the semi-accidental effect incorporat the scheme of decoration. Prelim sketches showing suggestions of colour teriors for execution in different material pigments have been collected into a gre wonderfully rendered drawings support a stand on the floor of the hall, and gallery students' and apprentices' work hibited which attains a high standar excellence. Some clever specimens of ing done as time tests by young painter also shown, together with examples of writing in which the arrangement of a number of words has been left to the i dual. The rendering of a good type of l character is generally very satisfacto these competitive paintings, and, indeed sign-writing throughout the exhibition strained and dignified in the majori cases.

One of a Series of Three Panels (each 16 ft. sq.) at a Cinema at Southampton.

THE OPENING CEREMONY.

the absence of the Lord Mayor of London . E. C. Moore) the Exhibition was formally ıred opened on Wednesday by Lord Askwith, was accompanied by Lady Askwith. There a large attendance, presided over by Mr. E. Campbell, F.I.B.D. (the President), ng those on the platform being Mr. J. ıard Cowtan (Master of the Painter ıers' Company) and Mrs. Barnard Cowtan, the Court and Wardens of the Company, De Jong (President of the Incorporated tute of British Decorators) and Sheriff and Middleton Dron.

ıe Chairman said the Federation had from to time promoted similar exhibitions in other great cities in various parts of the try, but this was the first time they had an exhibition in London. Their objects to stimulate their trade by bringing their , in an interesting and effective manner, he public notice, and to place before the bers of their trade, under one roof, every- g that could help them in their business. master decorator who came to their show thoroughly investigated every exhibit d go away not only invigorated by what he seen, with new ideas and new schemes ning in his mind, but he would have dis- red new methods and appliances for solving technical difficulties which were constantly ping up, and he would have a keener eciation of the work of his Federation. The ic would see in the exhibition that this try was, after many years, returning to a hy appreciation of the use of colours; the long reign of monotonous and dazzling e was nearly over, and that a proper use of ır and ornament might do much to lighten homes in this northern climate, and that itects might find a solution to the prohibitive of the most expensive materials used in inishing of buildings, if they would consider enormous possibilities that their craft and smen could offer them. It was a matter of non knowledge that until recently their had been under a cloud, and had not taken roper and rightful place in the decoration ieir public buildings. One of the reasons his low ebb undoubtedly was that some s ago the old race of skilled decorative smen had nearly died out, and no new ones being trained to take their place. The ic grew suspicious of the ability of the rator, and clung to white, until it came to nvested with a virtue, and colour to be idered as not quite respectable. But they changed all that, and that day they would ble to judge for themselves what operatives employers could do to train their young smen when they entered on such a task in l partnership, for no less than that was the titution of their national joint education me. He wanted to pay all honour to their atives' trade union for the honourable part had taken in that movement, sharing lly with their employers' federation not the work, but also the cost of that big rtaking. He ventured to think that that an example to the country, when both sides d forces for the benefit of their industry. result of only a few years' effort might be in the hundreds of examples of the work by lads in various groups of ages and s of training under their joint education me, which were exhibited in the gallery he exhibition. The curriculum of their nal joint education committee was accepted ver 100 of the technical schools throughout country, guided by nearly 50 local joint ation committees, and they were very y proud of this, which was only one of the y activities of the Federation. Their ufacturers would show them on the floor ıe hall that they could supply the finest rials and appliances the world could pro- , and they would show in the gallery that had in their shops and in training highly skilled craftsmen, capable of the finest work in every branch of their trade, and they looked with confidence to the near future for such a revival of the decorative arts as would stimulate them to further efforts, and provide them with some measure of reward for their labours.

Lord Askwith said he congratulated Mr. Cecil E. Campbell on being President of that Federation on that auspicious occasion on having their exhibition in London. The Federation was started in 1918, during the years of the war, and had progressed by leaps and bounds ever since. It was, however, a child of a much older Federation. The Federation seemed determined to keep the whole trade together in a joint enterprise, and as custodians of the interests of their trade were doing their best for all those engaged in it. They had not only concerned themselves with doing their best for all those engaged in it. They had a national joint education committee, and the results of their efforts in that direction would be seen in that hall, and the Chairman of that Committee was there that day—Mr. J. Gibson, of Manchester. Under the able leadership of this committee many branches of their trade had received encouragement and help, and phases of decorative art which had been lost had been restored to the nation. Much credit was also due to the Secretary of that Committee, Mr. Will Mellor. Those who went round the various stands would not fail to see the excellent results of this Committee's enterprise, and would feel how timely it was, in view of the Labour Minister's recent lament that there were not enough skilled men. The designs and craftsmanship at some stands were truly remarkable, and it would be an eye-opener to many to see what brilliancy could be produced by the aid of colours and clever workmanship. He would particularly mention one young man, Mr. Davidson, who had been trained and given scope, whose work not only represented talent but also genius.

Referring to the use of white lead, His Lordship said that a great artist, Sir Edwin Lutyens, R.A., had specially designed a white lead stand in order to illustrate what lead painting could do. He (Lord Askwith) contended it was the duty of their Federation adequately to protect the interests of their craft in this matter from the threat hanging over it. There was a draft convention before the Government, put forward by the International Labour Conference at Geneva, on the use of white lead and if it were agreed to it would affect not only a large section of their industry, but also their Dominions, especially Australia. Science and applied science had, however, it was hoped, come to the rescue, for visitors would be shown how, by the simple process of a damp rubbing down, the danger, which was in the dust, was obviated. It was hoped the Government would not take a drastic step that would so largely affect the livelihood of many people in this country. With the greatest hope that success would attend their efforts he declared the exhibition open.

Proposing a vote of thanks to Lord Askwith, Mr. Barnard Cowtan spoke of the educational work of the Painter Stainers' Company. As one of the final judges of the work exhibited, he said he felt they owed a great debt of gratitude to the National Federation.

Mr. J. A. Gibson (Chairman, National Joint Education Committee, and Secretary of the Operative Painters' Society), in seconding, said it was hoped the exhibition would help solve the unemployed problem, and that the public would be induced to make up the great arrears in regard to painting and decorating of their premises. Speaking of dilution in the building industry, he said he objected to slipshod methods in the training of their craftsmen, and he hoped, as one result of the exhibition, that the apprenticeship system would be properly taken up and co-ordinated throughout. Regarding the use of white lead, and speaking as an operative, he said it was never intended to have the supply immediately cut off and throw men out of work, but they felt it was a question of saving men's lives.

Mr. J. M. McDermid proposed, and Mr. Cantrill seconded, a vote of thanks to the Chairman who, in reply, asked the Press to let the public know they would materially help if they had their painting and decorating work done at other times than the holidays.

THE STANDS.

The Acme Patent Ladder Co. (Stand No. 10B).—The Acme Patent Ladder Co. (of Earlsfield) have on show at their stand No. 10B a variety of their patent extension ladders, made in two and three sections. Some of these ladders have round rungs and some oblong rungs. The Company are also showing their ordinary builders' ladders. A special feature of the exhibit is their labour-saving scaffold trestles. The firm are also showing for the first time a new improved paste-board. In this latter design the legs are made to fold up very compactly, and when opened they form a very rigid trestle.

Aerograph Co., Ltd. (Stand No. 28D).—This company, whose address is 43, Holborn-viaduct, W.C., exhibit their portable spray painting plant, with a complete range of the various instruments needed in order to obtain different results or effects. The use of spraying machinery is much on the increase. They also exhibit their new "Eagle" oxidiser, which oxidises linseed oil by a new method, giving advantages over other methods. This machine should prove to be of much interest to paint-makers, and others interested in the drying of oils.

Anaglypta, Lincrusta-Walton, Lignomus and Camloid (Stand No. 16).—This firm (of Darwen) has arranged its stand for the display of the firm's various materials in different styles and periods. A special feature is made of fixing Anaglypta without adhesive materials. Attractive framing and new panel effects are of interest.

The Bee Kay Waterproof Sandpaper Co. (Stands No. 38C & D).—The Bee Kay-Waterproof Sandpaper Co., of Brimsdown, make a feature of "Beekay" waterproof sandpaper, which is the outcome of experimental work carried out in this country. Facilities are afforded for test on this glass paper after several days' soaking in cold water and after boiling in water. The firm are also demonstrating with soda and soap water. The life of the paper is estimated as about a dozen times that of ordinary paper. The size of the sheets is the standard English size, 12 in. by 10 in. In addition to sandpaper, a large number of lead products produced by the Brimsdown Lead Co., are shown among which was noticed white lead basic sulphate of lead, dry and in paint form, red lead litharge, and other chemical compounds of lead. A sample of titanium, produced in this country, is of particular interest. It is produced from materials of British origin and the commercial development of which is now taking place.

Blundell, Spence & Co., Ltd. (Stand No. 30).—Messrs. Blundell, Spence & Co., Ltd. (of Hull, and 9, Upper Thames-street, E.C.4) are drawing special attention to panels coated with "Japonette," flat and glossy. Bricks showing the effect obtainable with Blundell's petrifying liquid enamel ("Pammel") can also be seen, together with specimens of paints and stainers, oils, varnishes and dry colours, and a collection of gums and raw materials used in the process of making the firm's numerous manufactures.

"The Builder," Ltd. (Stand No. X7).—The stand of *The Builder* exhibits a comprehensive selection of books of interest to the architect, surveyor, builder, decorator, and others interested in building and allied subjects. A model of the winning design, one of the classes, in Part I of *The Builder* Cost of Building Competition, in which architects submitted designs on which builders have submitted prices, is also on view.

Mr. A. Campbell (Stand No. 36C).—The "Campbell" stripping machine shown on this Stand is the invention of Mr. A. Campbell, of 21, Berners-street, W.1. The machine has been well tested and does all that is claimed for it. The most difficult paper, even though covered with sundry coats of paint, quickly surrenders to this most efficient machine.

Chadwick & Shapcott, Ltd. (Stand No. 4 C).—Messrs. Chadwick & Shapcott, Ltd., are the manufacturers of the well-known "Acorn" brand of painting brushes. They display a useful selection of brushes which are well worth attention.

Charles Churchill & Co., Ltd. (Stand No. 11C).—Messrs. Charles Churchill & Co., Ltd., of 9–15, Leonard-street, Finsbury (selling agents for Manning Abrasive Company of U.S.A.), are showing a complete range of abrasive papers and cloth, known as "Manning Speed-grits." The most interesting is the waterproof series, specially manufactured for the wet rubbing down of paint and varnish. They dispose of the menace of lead and pigment poisoning, and are suited to all kinds of fine paint-work, including interior and coach work. They are made with special paper and coated with artificial abrasives in such a way that, although used with water, the grains do not break down or come off. They are also more homogeneous and uniform. There are painted panels available for making practical trial of wet rubbing. "Metalite" cloth and garnet papers are also shown, manufactured by the same company. In addition to the above there is a small exhibit of the well-known "Norton" alundum safety products for making walking surfaces slip-proof and durable.

J. Davies & Allen (Stand No. 10A).—This firm (whose London address is 43, Basinghall-street, E.C.2) are showing "Glossolar" gold and silver enamels, which are used for interior and exterior decoration of all kinds. "Glossolar" paints are made with the highest grade metallic powders, and bronzing liquid, which is made from a patent recipe. When the powder and liquid are mixed together an excellent enamel surface is obtained. "Staneglas" window transparencies are shown. The article gives an exact imitation of stained glass or ground glass windows. It is made in rolls, so that any size window can be covered in one piece. The rolls are 9 yards long by ½ yard wide. Metallic powders (gold, silver, copper, green and various other shades) are also shown. They are used for theatrical and cinematograph decoration. "Nero" aluminium paint, which is one of the firm's exhibits, is used for painting lamp standards, railings, cinema seats, &c. It is guaranteed to be untarnishable, and a protection against rust, sea air, frost, &c. Paint brushes, varnish, and enamel brushes, liners, writers, &c., are included in the exhibit.

Dixon's White, Ltd. (Stand Nos. 26 C & D).—The stand of this firm (whose address is Albion Wharf, Bow) has been treated effectively with the aid of ordinary graining combs to form an ingenious and artistic pattern work arranged in harmonious colours and producing a very pleasing scheme. The whole of the work has been done in position with paints made from "Dixon's White," except the "Poilite" asbestos panels, which have been painted with three coats of "Rogg" concrete paint as an example of the results obtained with this paint on materials containing cement in their composition. Black painted paper fixed to an easel forms a ground on which to judge the comparative opacity and colour of "Dixon's White" paint against white lead. The fact that 1 cwt. of "Dixon's White" makes at least a gallon more paint than 1 cwt. of white lead is easily understood from a glance at the kegs of the two pigments which are displayed for comparison. Other exhibits of interest are "Dixon's White" undercoating and inside glossy paints, which have gained a wide reputation; "Fluxine," an enamel which works well in the brush, flows out perfectly and dries with a high lustre; "Metro" paint is a paint for exterior exposed positions; "Guarantee" paint, composed of white lead and zinc oxide, is a composition which is now generally accepted by paint technologists a s giving better results than any single pigment for exterior work.

Drew, Clark & Co. (Stand No. 36D).—This firm (of Leyton, E. 10), are showing the undermentioned goods:—"Diamond" patent extension ladders in two and three sections; "Diamond" patent auto-folding platform steps; push-up extension ladders; "Diamond" combined ladder and steps; "Raprig" patent sectional scaffold; ladders, steps, trestles, &c., for all purposes.

Easilit Blow Lamp Co., Ltd. (Stand No. 10).—The Easilit Blow Lamp Co., Ltd. (of 34, Watford-road, Kings Norton, Birmingham), display a selection of their various types of blow lamps. Various attachments are also being exhibited.

Eclipse Rail Track Ladder Co. (Stand No. 11B).—The Eclipse Rail Track Ladder Co. (of Bristol) exhibit an up-to-date range of extension ladders, steps, &c., conspicuous amongst which are the rail track extension ladders, extension scaffold boards and an adjustable roof scaffold.

Emdeca Metal Decoration Co., Ltd. (Stand No. 28B).—The Emdeca Metal Decoration Co., Ltd., of 97, Queen Victoria-street, London, E.C.4, are showing their "Emdeca" metal decoration made on zinc. Several new patterns are shown, including a combination of a white- and black tilette-brick pattern, and some gold mosaic work.

Gas Lighting Improvements Co, (Stand No 36B).—The Gas Lighting Improvements Co., Ltd., of Alexandra House, Queen's-square, W.C.1, show their speciality, "Glico" white spirit, a substitute for turpentine.

Goodlass, Wall & Co., Ltd. (Stand No. 7).—This firm, whose address is 42, Seel-street, Liverpool, are giving a demonstration of results produced by some of their manufactures when used for house painting in the ordinary manner. The materials used in the treatment of the scheme are the following:—"Combinol" flat oil paint, "Combinol" high gloss liquid paint, "Swansdown" white enamel, privet green, "Empire" fast red, "non-bleeding," brush graining stains.

Greeff & Co., Ltd. (Stand Nos. 18C and 18D).—Messrs. Greeff & Co., Ltd., of Thames House, Queen-street-place, E.C.4, have an exhibit illustrating the manufacture and uses of this non-poisonous material, a white pigment for the manufacture of paints for every class of decoration. The opacity or body of this pigment, which is one of its chief characteristics, is illustrated by various interesting exhibits, including panels in which it is painted out over differently coloured backgrounds, showing the complete obliteration in one coat. The immunity of this pigment from discoloration by sulphur gases, &c., forms the subject of another demonstration, also its resistance to attacks by corrosive gases and acids. Exposure tests of paint made with titanium are exhibited. These show an excellent condition of surface after four years' wear, the paint having neither cracked nor peeled, but slightly worn away from the surface, leaving an excellent condition for repainting.

Hadfields (Merton), Ltd. (Stand No. 23).—Messrs. Hadfields (Merton), Ltd., of Western-road, Mitcham, exhibit a fine example of brilliant colouring and excellent workmanship, clearly demonstrating the facility with which their "Heolin" productions may be handled by the craftsman. The design of the stand and the rich lacquer red with which it is finished give it a decidedly oriental atmosphere, while the corner columns of typical Chinese design, finished in "Heolin" white enamel, relieved by lacquer colours and gold, were a great success. The lines of black introduced as a framing or outline for the lacquer red imparted to the latter a richness which alone and unrelieved it would not exhibit; and this is typical of all the best examples of Chinese and Japanese lacquer work, for we find the colours invariably relieved by black or gold. The lacquer colours themselves are not brilliant, but they become so by judicious relief. On the interior of the stand flat and glaze scumble effects are shown, these are of considerable interest both fro practical and economic standpoint. effects are obtained in two coats from the material. The ground coat or body colou each case the "Heolin" obliterating followed by a coat of "Heolin" lime-flat colour scumbled and stippled. The effe exceedingly good, especially for such a mini specification. It is noticeable that scumbled colours are just as brilliant by arti light as in the daylight, and this is a point noting by those who are called upon to dec surfaces to be viewed in artificial light applies to almost all the scumbled glaze co provided the correct contrast between gr and glaze is employed.

Hoyle, Robson, Barnett & Co., Ltd. (S No. 5).—Messrs. Hoyle, Robson, Barnett & Ltd. (of St. Nicholas-chambers, Amen Co Newcastle-on-Tyne), associated with M John Smith & Sons (Haltwhistle), Ltd Newcastle-on-Tyne), have used their stan express two leading ideas, the decorative of pigments and the charm of fresh techni Both ideas are of immediate interest t practical man. The stand itself is designe simple manner; glass enamel pillars stand of the flat white walls and framing and qu designed leaded glass windows. The rear stand is designed in imitation stone to repr a model paint factory. Paint is actually on the machines within. Two rooms oc the front of the stand and present the f products in a practical manner. One pre a fresh rendering of a Chinese scheme panels in sunshine yellows, black and colours being suitably used. The room blue ceiling. The door and Chinese cabine in pigment relief and expanded paint, thus i ducing methods recently developed; the and ceilings are in "Saneros" water p The Chinese dragons on the door and ca are executed in "Protecteros." The room is decorated in "Hoyflat" flat oil with stained and varnished woodwork. P are exhibited of figure work executed in oil and flat oil paint. It is interesting to con the mural qualities of the two mate "Protecteros" glass paint is used in a new on the dado, while the frieze of little faun been laid on with flat paint and scored out a stylus. The doors throughout the stan of 5-ply built on frames and decorate various ways with simple sets of fittin lions' heads made from plastic wood, and in the manner of gesso over stain, while i others elaborate Chinese designs have been in expanded "Perfecteros." Both in q of paint and in newness of ideas visitors kinds will find much of interest in this s

Robert Ingham Clarke & Co., Ltd., a **Gay & Co., Ltd.** (Stand No. 9).—The first-n of this well-known organisation has the tation of being the largest manufacture varnish in the world. Viewing this stand the front the attention of the observer tracted to five white columns, which ar amples of craftsmanship. They are finis "Pearline" white enamel, and are exh with a background of deep rich blue which enhances the value and importa skilful display. In the plush backgroun three oval panels each treated with inpene paint of a distinctive colour. "Gaymat oil paint has been used for the decorati the room at the back of the stand; it is cl that this material is easier to apply, req no stiffening, and that the material is unaf by washing.

Kirkwood, Craig & Co., Ltd. (Stand No. —This firm, (of Eighth Avenue Works, Park, E.12) show their "Tapwata" dry "Adwata" paste powder, "Kirkor" tub for resale, and "Glood" fluid glue in containers for resale and in bulk for trad "Tapwata" dry paste when stirred int water is, we understand, quite safe to use the most delicate colours. "Adwata" powder, an economical adhesive, has to b

boiling water. "Kirkor" tube glue is an able adhesive producing an appearance. demand is chiefly for the purposes of rs to the home, fretwork, &c. "Glood" glue in red tins, is also ready for use in weather, but requires slight warmth in older months. Many amateur carpenters use this as well as professionals who, ver, take the larger containers. "Glood" rticularly useful to the home woodworker, se there is no need for him to keep a glue- n important consideration being that glue is continually heated loses its adhesive gth. There is also the question of unnt odours, dirt, &c., being eliminated.

vis Berger & Sons, Ltd. (STAND No. 32).—s. Lewis Berger & Sons, Ltd. (of Homerton, show at Stand 32 four specimen rooms ated to colour schemes created by the r Decorative Service Studio. The drawing- walls show an attractive shaded effect in one" flat oil paint, graduated from mauve am, whilst those of the bedroom introduce ti-colour treatment achieved by "mottling" "Matone" colours over a pink "Matone" d. A hall in a quiet grey scheme and a study—both in "Matroil" flat washable —complete an interesting series. The d stencils throughout are chosen from the r series of original exclusive designs. Doors woodwork are variously in "Pompeian" oat finishing paint, and "Scrumble" ng paint varnished with "Bergelac," the white work shows the use of "Exilac," is described as "the easier-working" enamel. Other materials shown include "prepared and "M.P.P." semi-paste s, "Homerton" genuine white lead paint, kgloss" finishing paint, "S. & R." ural and roof paint, "Damp Resister" "Wundercote" one-coat undercoating, manoid" aluminium paint, "Solvoid" remover, "Sealic" colourproofing, "Arm" preservative stain, "Tilo" plastic epairing composition and "Signal Red" el.

n Line & Sons (STAND No. 17).—Messrs. Line & Sons (incorporating John Dann ns), of 213–15, Tottenham Court-road, have a well-designed stand of wood upon to demonstrate the application of this materials. It has a flat semi-circular ornice and facia supported on two columns d with black "Triamite" enamel. Messrs. have a new material for the treatment of "Koverfloor," which gives an elastic which is both waterproof and weather-

der Brothers (STAND No. 21).—Messrs. r Brothers (Wolverhampton) show a large n decorated in a bold and effective scheme ouring. The exterior is mainly white, d by panels of rich green, and a frieze of urple, a number of finely varnished oval specimens being hung on the walls. terior scheme consists of a series of rich panels with black mouldings on a ground -shell white enamel. The exterior white nts the firm's "Flexolin" white enamel, has a lustre and china-like smoothness. namel is suitable for both exterior and r work, its elasticity enabling it to and climatic changes of temperature t the slightest risk of cracking. The r green and purple and the interior coloured panels are done in "Vernasca," the first flat oil paints to be put on the t. The feature of the exhibit is the new k Ebony Finish," which is now being for the first time. Every decorator knows fficulty of obtaining a smooth semi-lustre with the effect of polished ebony, and what has been achieved in this exhibit. ouldings, dado rail and wainscot are hroughout with this article, and show ffectively the results obtainable with it.

nal Federation of Paint, Colour, and n Manufacturers (STAND No. 27).—the most interesting stands is that exby the National Federation of Associated Paint, Colour, & Varnish Manufacturers of the United Kingdom, in connection with "Paint More" campaign. It was in the early part of 1921 that the National Federation of Associated Paint, Colour, and Varnish Manufacturers conceived the idea of a national campaign, with a view to educating property owners in the use of paint, and bringing home to them the results of the neglect of its use. That the capacity for the consumption of paint throughout the country is still greatly in excess of the demand does not admit of argument. How to create this increased demand is the problem, not for any individual manufacturer, but for the industry as a whole—manufacturers, merchants, and master painters and decorators.

The National Federation of Master Painters and Decorators.—This Federation have their own stands, one for the display of drawings, and one where members of the organisation are in attendance to give information and discuss problems with visitors. The organisation is a very live body, which has been quietly working to establish, or re-establish a high standard of craftsmanship. A thoroughly representative and, at the same time, high standard of exhibits has been produced as the result of its Competition Scheme for apprentices and journeymen; the results are very interesting. The other stand of the Federation displays coloured perspective drawings of interiors, notable amongst which are drawings of the late Mr. J. D. Crace, kindly lent by the Council of the Institute of British Decorators. Other drawings by decorators who are members of the Federation serve to prove that the trade has still a good number of decorators who are capable of originating schemes of decoration suitable for difficult situations.

Naylor Bros. (London), Ltd. (STAND No. 24).—Messrs. Naylor Brothers (London), Ltd., have a stand consisting of four rooms—a drawing-room, dining-room, bedroom and bathroom, and each room displays different finishes, one on each wall. The drawing-room is finished in blue and brown, the wall and dado being distempered and the panel mouldings, dado rail, and skirting showing the "super-elastic" gloss paint. The panels are finished with paper, and the door and architrave moulding are of moulded mahogany—these also showing the fine polishes to good effect. In the bathroom one wall is papered with a white and patterned paper, made stain proof with "Suwidec" varnish, whilst the other wall is treated in two colours with "S.E.G." paint, two coats only being used. The door in this case is grained to imitate oak. In the dining-room one wall is oak-panelled and finished with a flat varnish, "Pale Encaustic Copal," whilst the door is of oak, and the other wall distempered, panelled and papered in shades of brown, the fine washable distemper and "S.E.G." paint again being used. In the bedroom the door and architrave mouldings are of "S.E.G." two-coat paint, which gives an enamel blue surface, and the walls, as in the dining- and drawing-room, are distempered, painted and papered in a combination of greys and browns. The floors in all rooms except the bathroom are finished with the fine "Fasthin" varnish and stain for floor and woodwork, and one coat only is used, together with a coat of floor varnish to meet the hard wear necessary for such exacting conditions as it will have to withstand during the week.

Thos. Parsons & Sons (STAND No. 37).—At this stand Messrs. Thos. Parsons & Sons (of 315-317, Oxford-street, W.1) exhibit a variety of panels in modern and period designs, doors, &c., in various colour schemes carried out in the firm's specialities, including "Endelline" enamel for interior or exterior use, producing a porcelain-like finish that may be repeatedly washed without deterioration; "Endelflat" enamel (flat), for interior use, producing a soft, almost dead flat finish of a hygienic and washable character; "Lacreite" enamel, a cheaper enamel for inside or outside work; "Unicote" flat finish, an innovation in wall decorative materials, which shows a finer surface than distemper and can be repeatedly washed without deterioration; "Parso-Glaze," a transparent glazing material produced in a wide selection of shades (it produces effects with brighter finishes than can be gained with opaque paints, and can also be used as a stain on new woodwork or as a graining colour); Parsons' undercoating body white, a ready-mixed undercoating paint, with a surface particularly adapted to take the finishing coat of gloss or flat enamel, tinted to suit the finishing colour; and Parsons' copal varnishes.

A demonstration of the Parsons' colourmeter, a colour-producing machine, is given on the stand.

Pavitt & Sons (STAND No 20H).—This firm (of 69, Southampton-row, W.C.) is showing a varied assortment of painters' and decorators' brushes and sundries, also their "Ardenbrite" gold and metallic bronze paints, which they claim to be untarnishable and washable, and guaranteed to keep their colour for any length of time. These are especially suitable for radiator work, cinemas, theatres, &c. The firm is making a display of hand-painted panels decorated with "Gessotex," the new wall-covering. It is easily applied, artistic in colour, and capable of developments in the hands of the craft.

Pinchin, Johnson & Co., Ltd., associated with Wilkinson, Heywood & Clark, Ltd. (STAND No. 8).—The special attraction at this exhibit is the range of Pinchin, Johnson super-finishes, embodying, "Gripon" super-paint, satinette enamel paint, "Deydol" distemper, "Hygeia" flat wall finish and "Gripon" supervar. Singly and collectively these materials cater for all modern decorative needs and possess merits which will doubtless appeal to the practical decorator. Shade cards, booklets, &c., are available on the stand, whilst those interested can also obtain information regarding any or all of the Pinchin, Johnson super-finishes direct from the firm's representatives in attendance. There are also exhibits of other productions, including iron paints, preservatives, lacquers, stains, polishes, concrete dressing, varnishes for all purposes, silveroid, and every material that the decorative trade needs. The head office of the firm is General Buildings, Aldwych, W.C.2.

Raines & Porter, Ltd. (STAND No. 33). The stand of this firm (of Wincolmlee, Hull) is in the form of a Greek temple in Roman Doric. The interior is set out with four panels on which are life-sized figures painted of the four arts, viz., Painting, Music, Sculpture, and Architecture. The interior colour scheme is in blue, ivory and black, carried out with "Velmatt" flat wall finish de luxe. The supporting columns and pillars are done with "Gloselene" enamel rubbed down to a matt finish, ivory in colour. The following are some of the firm's manufactures, samples and colour books of which can be obtained at the Stand:—"Muradek," an improved paste distemper; "Velmatt," a flat wall finish de luxe; Gloselene" enamel; "Denzene" undercoating; "Flexine" scumble stains and glaze; "Tranby" permanent greens; "Autolac" coach colours, decorators' colours in oil, varnishes, &c.

Rawlplug Co.—The Rawlplug Co., Ltd. of Gloucester House, Cromwell-road, S.W.7, are exhibiting "Rawlplugs," recess screws, and aluminium fittings. Throughout the day demonstrations in the use of "Rawlplugs" and recess screws are given. Recess screws can, it is claimed, be driven home in a third to a quarter of the time which it takes to drive home an ordinary slot-headed type of screw.

Ridgeley Trimmer Co. (STAND NOS. 2 A & B).—The Ridgeley Trimmer Co. (London), Ltd., 117, Clerkenwell-road, London, E.C., show examples of their specialities, notably the trimmer and their special folding table for the use of the paperhanger. They also show a material which appears to be rather a departure from their usual lines—a wall-covering which, it is claimed, introduces features that are entirely new. The material "Sanitas" is one for which

the firm have the British rights; they now exhibit it for the first time.

Regent Wallpaper Co. (Stand No. 1 Y).—This firm, of Imperial Works, Brixton, S.W., show an unique range of their original hand-worked decorations, which are designed and produced in their own studios. They are worth the attention of all up-to-date decorators, being extremely different in the treatment of both design and colouring. The "Ely" panelled nursery frieze, as shown on the facia of the stand, is a typical example of the productions of this firm.

Salubra Co. (Stand No. 13).—This stand is devoted to exhibits of Salubra, which is a wall-paper guaranteed to be absolutely fadeless, its colours being fast-to-light and unaffected by any sort of exposure. The stand is arranged in a series of bays or recesses, each containing a different pattern or style of Salubra for various rooms and various uses, including decorative suggestions. The material can be cleaned with soap and water, and even a stiff brush, necessary to remove ink-stains or other exceptionally obstinate marks, does not injure the pattern. The material is non-porous, and does not harbour germs and dust particles. It can be kept rigorously clean in precisely the same manner as smoother surfaces, such as tiling, glass or wood. From the paperhanging point of view Salubra is easy to fix, and in no case is a white lining paper required. The range of designs shown at the Stand is exceptionally large, full provision being made for all requirements. Considerable ingenuity has been shown with regard to patterns, in order to give scope for imposed strips, borders, frame and panel effects, dados and friezes. Tile patterns for bathrooms, lavatories and kitchens; plain tints for walls and ceilings; "tapestry" effects for all purposes are also shown. To demonstrate the imperviousness to water of the material—materially and in colour-fastness—a small fountain is provided at the entrance to the stand, in which are floating some pieces of the new wall-covering. "Salubra" is supplied wholesale only by the Salubra Company, 11, Fitzroy-square, London, W.1.

Arthur Sanderson & Sons, Ltd. (Stand No. 25).—This firm, whose address is 51–5, Berners-street, W.1, display their fast-to-light wall papers. A special exhibit of much interest is "Tekko," a silk substitute. The firm's leather papers are applied on the interior of the stand, while the exterior shows the excellent qualities of "Sanstonia." The general arrangement of the stand affords an opportunity of the firm demonstrating their various productions to advantage.

The Silicate Paint Co. (Stands No. 38A and B.)—The Silicate Paint Co. (Charlton) show at Stand No. 38A and B specimens of interior panelled wall decoration carried out in various colours, many of them recently introduced. Styles and mouldings are grey and white with lake dado. This is to show the adaptability of Duresco for the class of work now so much in vogue. The whole of the exterior is painted with Portland cement colour as a ground, the writing and lining being executed in dark blue "Silpaco" flat oil paint.

Staunton, Ltd. (Stand Nos. 20B and D).—Messrs. Staunton, Ltd., of 43, Johnson-street, S.W.1, are displaying a class of goods that should appeal to the English market. Their speciality is semi-trimmed wall papers, the edges being treated so that the part usually cut off is removed in a moment. These wall papers have a distinctive note about them.

The Steleonite Metal Decorations (Stand No. 10C).—This firm (of 415, Old Ford-road, E. 3) are showing the new Tileonite enamelled metal decoration, the special feature of which is the dovetailed interlocking joint in all brick designs, thereby avoiding the breaking of bond, and making the surface one continuous whole. The firm make Tileonite on zinc, aluminium and tinplate, and we understand that, as a decoration of this kind, it is for the first time manufactured in Great Britain. The designs are based on British sizes.

Stephens & Carter, Ltd. (Stand No. 2 D).—This firm (of Paddington-green, W. 2) have on view specimens of ladders, extension ladders, steps, trestles, and all plant applicable to the decorating trade. There is also a model of Spencer's patent travelling cradle—of which this firm are now the sole proprietors—demonstrating the method by which the cradle can be made to travel on one track any length required, or even round corners.

Thornley & Knight, Ltd. (Stand Nos. 18 A & 18 B).—Messrs. Thornley & Knight, Ltd. (of Bordesley Green-road, Birmingham), have had the whole of their stand done with two shades of "Asbestolin" water paint in light and dark Wedgwood-blue, together with the mouldings and panel, which have been picked out in white. The relief work and upright beading of the stand have been done with white "Tekamatte" flat waterproof oil wall paint. This material is manufactured in a number of shades, and may be washed with soap and water without deterioration. "Tekamatte" can be applied over wood, plaster, iron, stone, cement, distemper, or metal. The door, canopy and posts of the stand have been done with white enamel, which can be tinted to any light shade by using pure tube colours. Panels of "Scumblette" oil graining and staining colours, together with decorators' varnishes, have been prepared. The ceilings of the stand have been finished off with flat white Japan, which produces a flat, smooth and non-absorbent surface that can be washed with soap and water. "Tekavar" copal varnish is also introduced, and panels of it exhibited.

Tudor, Mash & Co., Ltd. (Stand No. 3).—Messrs. Tudor, Mash & Co., Ltd., of Wilton-road, Victoria, S.W. 1, and High-street, Camden Town, N.W. 1, have in use on their stand the exhibition case used by them 58 years ago, when they were awarded a silver medal at Oporto. The chief interest of this firm lies in the production of ready-made paints. For their "Snowflat" they claim that it is the densest white lead paint on the market.

The Tynecastle Company (Stand No. 6).—The Tynecastle Company (of Edinburgh) are showing their varied productions in the decorative treatment of their stand. There are high and low relief enrichments in canvas and vellum, decorated materials, examples of the "device" frieze formed of applied ornament and panels suitable for picture house or theatre, A portion of the stand is devoted to wall-paper.

Walpamur Co., Ltd. (Stand No. 35).—The inside of the stand of the Walpamur Co., Ltd. (of Darwen), is divided into three rooms, each representing a portion of a decorative scheme for a different type of interior. One half suggests a simple treatment for a cinema theatre, the colour scheme being grey and jade green with gold decoratings. The walls are painted with "Walpamur" water paint and the woodwork in "Muromatte." The remaining half shows two schemes. One, for a café, in orange, black, and gold, with decorative panels carried out in "Muromatte." The other part is a portion of a boudoir with a panelled dado, painted with glossy white "Mirabol," pale blue walls, painted "Muromatte," lined out with gold. The exterior is a mauve grey "Duradio" picked out with silver. The columns are painted with white and pale yellow "Mirabol," with black and silver caps and pedestals in black "Duradio." One end represents the exterior of a small town house, painted in white "Amorol," with door and window boxes in drop black, and varished with "Hall Door" varnish.

White Lead Manufacturers (Stand No. 34).—This stand was designed by Sir Edwin Lutyens, R.A., for the white lead makers to demonstrate the value of white lead. The representatives in attendance are demonstrating the undoubted efficiency of waterproof glass paper as a rubbing-down medium in lieu of pumice stone or dry glass paper. There is no doubt that the health of the painter will benefit the introduction of this change of met which prevents dust of any kind floating al and will make it much more easy for decorator to execute his job cleanly and

PAINTERS' AND DECOR TORS' FEDERATION.

ANNUAL MEETING.

The annual meeting of the National Fed tion of Master Painters and Decorators England and Wales was held on Tuesday Holland Park Hall, Mr. C. E. Campbell, President, in the chair.

The President, in his address, said when the trade guilds flourished every ployer was an expert craftsman, and it one of the objects of the Federation to fo that pride of craft which had always been highest incentive in the production of the work.

Mr. W. G. Sutherland (Secretary) prese a report on behalf of the Council, in wh it was stated that it was to be feared there would be no general revival in the acti of the trade until the great staple indust became more prosperous. During the the Council had made a notable begini with a national working rule agreement, while it was too much to expect its adop entirely without friction, it should prove beginning of much smoother working conditi in the building trade.

A report from the Materials Committee sta that an invitation was received from the wh lead manufacturers to join them in pressing Government not to ratify the prohibition clau of the convention adopted at Geneva two ye ago. The International Materials Commit at a special meeting declined the invitati although they were prepared not to opp a certain extension of exceptions. The Ho Office Committee of 1911 reported in fav of the total prohibition of white lead in painti but a recent Committee took the view that certain painting processes no adequate su stitute for white lead was available. T Government was considering the matter a had not yet announced a decision.

ANNUAL DINNER.

A record number attended the ann dinner of the Federation, held at the Ho Great Central on Tuesday last, under chairmanship of the President, Mr. Cecil Campbell. Amongst those present were M Alfred Gotch (President of the Royal Ins tute of British Architects), Mr. E. Partridge (President of the Society of Arc tects), Mr. T. Middleton Dron (Sheriff of City of London), Mr. A. Barnard Cowt (Master of the Worshipful Company Painter Stainers), Mr. R. Sennett (Sheriff the City of London), Mr. E. Stanley Ha M.A., F.R.I.B.A. (President of the Archit tural Association), Mr. John Sibthorpe, I T. M. Legge (H.M. Chief Medical Inspecto Mr. G. Bellhouse (H.M. Chief Inspector Factories), Mr. G. E. Topham, Mr. H. Dockrell (President, National Association Master Painters and Decorators of Irelan Mr. Hugh Davies (H.M. Inspector, Board Education), Mr. A. Sage (Principal, L.C. School of Building), Mr. T. P. Benn (Head of the Department of Architectu Building and Surveying of the Northern Po technic), Mr. A. G. White (Secretary of t National Federation of Building Trades E ployers), Mr. Noel Heaton, Mr. J. C. Vaughan (The Worshipful Company of Pa ter Stainers), Mr. Arthur Porter (Worship Company of Painter Stainers), Mr. F. Jong (President, Incorporated Institute British Decorators), Mr. W. H. Nicho (President of the National Federation Building Trades Employers), Mr. H. Brya Newbold, M.S.A., Mr. F. J. Walton (Pre

f the London Master Builders' Associa-
Mr. D. Colquhoun (President, National
ation of Master Painters in Scotland),
G. J. Cameron (Secretary, National
ation of Master Painters of Scotland),
H. J. Duncan (Secretary, National
ation of Master Painters and Decora-
f Ireland), Mr. W. Scott (President,
ite of Plumbers), Mr. J. W. Alder
ident-Elect of the Federation), Mr.
Hawkes (City and Guilds of London
ite), Mr. J. A. Gibson (Chairman,
al Painters' and Decorators' Joint
ittee), Mr. Charles Woodward,
B.A., Mr. R. G. Muir, F.R.I.B.A.,
G. M. Trench, F.R.I.B.A., and Mr.
Bush, A.R.I.B.A.

r the loyal toasts had been proposed by
RESIDENT and duly honoured, MR. JOHN
ORPE proposed "The National Federa-
Master Painters and Decorators." In
urse of his remarks, he said more than
eration ago a meeting was held at
rs' Hall with a view to forming just
Federation as that represented that
g; but that meeting was a fiasco be-
of the hostilities which had been left as
tage from similar previous meetings.
er, there were men of vision present at
neeting who refused to accept defeat,
at failure was followed by success in
ester, Newcastle, and Birmingham,
om that day onward the Federation had
ssed. The founders of the Federation
great idea of uplifting the craft, and
st things first. The craft could only
lifted by a better standard of crafts-
ip, and that could only be by education
boys in the industry. The dream of
rning body for the trades had been ful-
but were they to be content? Could
ow fold their arms and say no more
be done? Was there not something
hung about the feet of the craft, de-
ting both employed and employer?
was. There was the fact that they
be moderately busy for eight months
twelve and in absolute idleness for the
four. The decorator was thoroughly
o the evil, but the public did not realise
t meant a great deal to them in that
necessarily got worse work in the busy
. There was a limited number of first-
men, and if those men could be con-
employed during the whole year all
ork would be of first-class quality, but
vas impossible if the bulk of the work
ut in hand during a short season. If
iblic were educated in those facts the
ry could secure a continuity of employ-
which was a desideratum to be con-
d. He was firmly convinced that the
ation could tackle and solve that prob-
and he wished it every success in its
.

responding, the PRESIDENT, after em-
ing the necessity for good-fellowship be-
all members of the industries, said the
hat the Federation had promoted friend-
throughout its membership was itself
ent reason for its existence, if it did
ng else. The Federation was fully alive
e detrimental effects of the seasonal
of the decorating trades, and was
g every endeavour to secure continuity
rk throughout the year.

proposing "Our Guests," MR. J. E.
ERWORTH, in referring to the effects of
on buildings in London, said the grime
e atmosphere had endowed St. Paul's
a new beauty of light and shade in
Wren had no hand. So long ago as
he said, the Painter Stainers' Company
urated a "labour exchange" for the
with which it was concerned. With
creasing complexity of later days, how-
and the new conditions which were
the necessity for trade unions and em-
's' organisations became manifest, and
ompany did not perhaps occupy that
on in the regard of the rank and file
craft which it held in days gone by.
ompany had, however, done great work
her directions, such as education and charity. In conclusion, he urged the necessity for co-operation between architects and builders and decorators.

Mr. T. Dron, Mr. A. B. Cowtan, Mr. Alfred Gotch, and Mr. W. H. Nicholls responded to the toast.

MR. COWTAN said the Painter Stainers' Company, in company with all the other Companies in the City of London, was not inactive. At the present time it had a school at Great Titchfield-street, where good work was being done in the training of craftsmen in the decorating and other crafts. The exhibition at Holland Park was excellent. The journeyman was fine, but the work of the boys should not be overlooked, for several of the young men's work on exhibition showed that those young men had a great future before them. Such men would raise, and continue to raise, the status of the craft in which they were all interested.

MR. GOTCH said architecture and decoration had from the outset gone very largely hand in hand. He was extremely glad to hear that one of the activities of the Federation was the training of young members in the crafts which they followed. It was highly desirable that craftsmen of every kind should be trained to have an initiative of their own. Architects welcomed any craftsmen who could help them from their own resources. The architect was, after all, only the chief workman, and the more the allied crafts could help them in their work the better would it be for the architect and the better it would be for the public. He hoped decorators would help architects with the exuberance of their inventions, and architects would help with the austerity of their taste. He would like to make one suggestion. Architects were fascinated with the study of colour; it came before them in various forms. Feeling as he did what wonderful delight there was in the study and observation of colour, it occurred to him that it might be possible for members of the Federation who had an inventive turn of mind to establish colour concerts in which the appeal would not be to the ear but to the eye.

MR. NICHOLLS urged the necessity for a closer working between the builder and decorator.

Other toasts included "The Ladies," proposed by Mr. H. S. Manning, and responded to by Mr. A. Andrews; "Kindred Associations," proposed by Mr. D. Green, and responded to by Mr. F. de Jong, Mr. D. Colquhoun, and Mr. H. Dockrell; "Technical Education," proposed by Mr. T. Foster, responded to by Mr. J. A. Gibson; and "The President," proposed by Mr. J. W. Aldo, and responded to by Mr. C. E. Campbell.

BOOK REVIEWS.

Memoirs of the Geological Survey: Special Reports on the Mineral Resources of Great Britain. Vol. II, Barytes and Witherite. By G. V. WILSON, T. EASTWOOD, R. W. POCOCK, D. A. WRAY, and T. ROBERTSON. With contributions by H. G. DINES, A.R.S.M. London: His Majesty's Stationery Office.) Price 3s. net.

THE war period, during which foreign supplies were very considerably diminished, was marked by a great increase in the output of barium minerals from British mines. Production from all native sources except Derbyshire—which reached its maximum in 1919—was greatest between the years 1914 and 1916, when the mines of the North of England, of Shropshire and North Wales, and of Ireland, showed a simultaneous access of activity. In pre-war times development in one quarter was generally accompanied by diminished production in the others, and the chart on Plate 1 of the Geological Survey's handbook shows how the great international calamity reacted upon the British supply.

"Barytes, barite, heavyspar, or barium sulphate ($BaSO_4$) contains 65·7 per cent. of barium oxide or baryta (BaO).

"The commercial uses of barytes are largely dependent on the fact that it is a heavy white mineral, cheap, and chemically inert. The market price depends not so much on purity as on colour, and the grades produced are arranged on that basis. The finest quality white powder is used in the preparation of white paints, for wall papers, for 'bleaching' flannel, shoddy cloth and Austrian flour; while inferior darker grades are extensively used in the manufacture of lithopone (a paint composed of a variable mixture of zinc oxide, zinc carbonate, zinc sulphide, and barium sulphate), and in asbestos goods."

It is also used for making "artificial ivory," fertilizers, boiler-compounds, insecticides, peroxide of hydrogen, and "artificial driftwood salts."

"Witherite or barium carbonate ($BaCO_3$) carries 77·6 per cent. of barium oxide (BaO)," is not largely used in its native state, but is valuable as a source of supply for the re-agents used in various processes of chemistry and manufacture.

The book includes charts and maps, and a description in detail of the mines of Great Britain divided into four main groups: The six northern counties; the mines of Derbyshire, Shropshire, and the Welsh Border; the mines of Wales and the West of England; and the mines of Scotland.

The House You Want. By R. RANDAL PHILLIPS, Hon. A.R.I.B.A. (London: 20, Tavistock street, W.C.2.) Price 2s. 6d. net.

Quite a useful amount of information is conveyed to the prospective house builder in "The House You Want," by Mr. R. Randal Phillips. The points of view of the architect, the builder, the sanitary engineer, the housewife, and the solicitor are simply set forth, and it is possible that the very brevity and simplicity of the writing will give value and emphasis to it. There is not absent a hint of partiality as to Georgian work, which, perhaps, might as well have been omitted, and the doubt about "quaintness." However, it is probable most of the reading public value the dignity imparted to a small house by a Georgian architect rather than an affected Jacobean or Tudor quaintness.

Meteorological Office, Air Ministry. Eighth Report of the Committee for the Investigation of Atmospheric Pollution. 1923. Price 3s. net.

This report deals with observations made during the year ending March 31st, 1922. During that year twelve authorities have maintained thirty-one standard gauges to test atmospheric pollution, six being situated in the County of London. Twenty-four comprehensive tables of monthly records are included; these give the rainfall, the quantities of soluble and insoluble matter, and the total solids in metric tons per 100 square kilometres. It is instructive to note that in Rochdale about 66 per cent. of deposited matter was due to factory smoke; this is as one would expect, but it does not bear out the contention often urged that the domestic chimney is a greater offender than the factory. Figures are given for Kew, Westminster and Savoy-hill, on the basis of summer days and foggy and non-foggy winter days, separate consideration being given to (*a*) Week-days, (*b*) Saturdays, and (*c*) Sundays. The results of these investigations are plotted in curves, and the experiments as a whole go to prove that summer impurity in London is only about one-third of the winter impurity. Seeing that it is especially important for the public health to make the fullest use of winter sun, the winter smoke clouds are doubly obnoxious. The report emphasizes the evil effects of smoke on public health and says: "It is doubtful how far exercises involving deep breathing should be recommended to city dwellers under present conditions, owing to the polluted state of the air." We hope that these results, and the lesson they convey, will be seen and understood by those who so far have regarded smoke as a natural and inevitable accompaniment to city life.

RAILWAY HOUSING SCHEMES.

G.W. Railway.

LIKE most other large industrial undertakings the Great Western Railway has been faced with the urgent problem of housing their staff, who number in all over 100,000 men. Various proposals were considered by the Company's Surveyor and Estate Agent, Mr. F. W. Showers, F.S.I. Finally, two schemes were adopted.

(*a*) For assisting the staff to purchase their houses. In this case, the Company are prepared to lend 90 per cent. of the value on mortgage at 5 per cent., repayable within 20 years.

(*b*) For assisting the staff to form Public Utility Housing Societies in various centres, for the purpose of letting houses to members. The Company are prepared to purchase sites, to arrange for their lay-out, to construct roads and sewers and to lease the site for 99 years on a 4 per cent. ground rent basis to societies, in sections as they are required for building. In addition, the Company, in approved cases, will provide the capital for the houses up to 90 per cent of cost at 4 per cent. interest, repayment being spread over 50 years. The members of each Society, therefore, collectively, have only to find 10 per cent.

The first society formed is the Great Western (London) Garden Village Society, Ltd., and other Societies have been formed, or are in process of establishment, at Cardiff, Barry, Penarth, Newport, Severn Tunnel, Swansea, Port Talbot, Llanelly, and elsewhere.

For the Great Western (London) Society, the Company have acquired two estates—one at Acton, W.; and the other at Hayes, Middlesex. The former consists of 46 acres, making ultimate provision for some 500 houses; the Hayes site being 60 acres in area, with provision for 600 houses. The lay-out of both estates provides ample open space and good gardens, and the houses will be in pairs and groups of four. At Acton, the Company have collaborated with the Borough Council in the construction of a new "through" road, 50 ft. wide, connecting Noel-road with Twyford-avenue and with Hanger-hill, Ealing. This will be an important public improvement in the district and is included in the Council's town-planning scheme.

Contracts for the erection of the first 50 houses at Acton and for the roads and sewers serving them have been let to Mr. Ernest Clarke, of Melton Mowbray; and for the first 50 houses at Hayes to Messrs. John Laing & Son, Ltd., of Carlisle and London. Forty of these first 100 houses have parlours and upstairs bathrooms, the others being of the large single living-room type with bathrooms downstairs. Some groups will be built in 11 in. cavity walls and Luton facings, and others in 9 in. walls and roughcast—all being roofed with hand-made tiles. Gas and electric light is to be laid on in each case, with hot water supply and all modern conveniences.

The architectural work in connection with these schemes has been entrusted to Mr. T. Alwyn Lloyd, F.R.I.B.A., of Cardiff and London, Architect to the Welsh Town-Planning and Housing Trust, Ltd; the Organizing Secretary for the Societies being Mr. E. Hall Williams, who is connected with the same organisation.

L. & N.E.R. Scheme.

With a view to solving the housing problem so far as their own employees are concerned, the directors of the London and North-Eastern Railway have in hand a scheme whereby employees may purchase their own houses with the financial assistance of the Company. The scheme has already been commenced at Gosforth, where the men are enabled to purchase new houses by weekly payments from their wages, and a similar scheme is being advanced at Darlington, where the Company have large constructional and repair establishments. The Company, it is understood, are prepared to advance £50,000 for houses for employees working in that town, at 4 per cent.

CIVIL ENGINEERING GEOLOGY.*

The author of this volume lays considerable stress, and rightly, on the fact that an engineer undertaking constructional works of any size should have a good working knowledge of geology. The first care of an efficient engineer will be to inform himself with regard to the geological features of the site he has to deal with. As stated in the preface, the nucleus of the book was obtained from a paper prepared in 1921 on "Some engineering aspects of Geology" for the newly-formed Institution of Engineers (India). Hence it follows, naturally, that much of the geological matter has particular reference to India. The book contains 140 pages, divided into three parts: Water supply and irrigation, field operations, and building material; is well illustrated, the photographs and photomicrographs being excellent.

Under the heading water supply, it is clearly shown that requisite knowledge of the underlying strata is absolutely necessary. Thus a valley with a perfect basin structure may be utterly worthless as a reservoir site if the beds forming the basin are open-textured and therefore porous. In an endeavour to increase the capacity of a moderate well by deepening, a strong joint may be encountered which will possibly drain the well. The trouble may be overcome but at considerable expense. The geological structure designated by the word artesian, is often misunderstood. Artesian conditions may exist, but unless the top of the bore-hole is correctly placed with reference to the height of the outcrop of the porous bed the water may have to be pumped out of the well instead of flowing freely.

Under field operations the chapter on retaining walls is of a very practical nature. The calculation of the dimensions does not come within the scope of the book, being considered as outside the province of the geologist, but the question of foundations is considered and is one that calls for skill on the part of the engineer. Evidence of which can be found in the examples of many lofty buildings of enormous weight supported on pillar foundations, the pressure being as much as 1,000 tons, and hence the foundations of a heavy building are sometimes the cause of anxiety.

In London the general rule is to get down to the ballast or to the London clay, the chief consideration being, in most cases, to obtain uniform distribution of the weight. In many cases dams have to be built in shallow valleys in rocks which are seldom satisfactory from the engineer's point of view. The particulars given of the individual beds of strata should prove useful in this respect. The troubles that may arise, due to faults, soft or porous unconsolidated strata, open joint planes and other fissures, are clearly explained, as also are the essential considerations in tunnelling. For any engineering undertaking each site requires a thorough investigation of the material and structural features of the underlying strata, and in some materials, *i.e.*, sand and gravels, the angles of repose are affected by the condition of the material if wet or dry.

The effect of earthquakes on structures does not concern the engineer at home, but, probably by an oversight, the use of reinforced concrete is not mentioned with regard to buildings to resist earthquake shocks, although their effect on buildings is mentioned.

Building material covers definition of terms and mode of occurrence of rocks. For Great Britain the geological maps published by the Geological Survey Department give invaluable information to engineers. The photomicrographs in this section, together with the text, explain clearly that the porous or impervious nature of a rock is dependent on size of the pore spaces.

The three great classes into which it is usual to group the various types of rock which have been recognised on the crust of the earth—Igneous, Sedimentary and Metamorphic—are given with further sub-divisions and classification. The igneous rocks form no less than per cent. of the whole. The physical prope of rocks and choice of materials in this se should prove of great service in choosing for building purposes, and to understand properties of rocks, a knowledge of geolo necessary. For ordinary use in Great Br the building stones are known more familiar granites, limestones and sandstones. Stre and durability are the two most impo considerations. In this connection, hard defined as resistance to abrasion, is de by numbers, and found by scratching a sm surface of the mineral with a steel knife comparing with effect of the knife on wi glass. In a similar way metals under Brinell test are arranged. In metals, how hardness is treated as resistance to penetra and is found by calculation of the diamet the impression made by a steel ball unc standard load. The crushing strength of d ent specimens of the same stone will be f to vary under test. In addition porosity weathering qualities are frequently of cons able importance.

It is essential that care should be take all cases of building work, more particu in the case of sandstones and other rocks w present distinctive planes of stratificatio bed the stones in the structure in the pos of natural bedding, because, if used in any way, they usually disintegrate much rapidly under atmospheric influence. At t it may not be possible to obtain reliable to determine the weathering properties stone for a particular locality. In such a examination of the stone that has used locally will provide useful informa Crystalline stone is more weather resi than non-crystalline, and some kinds of require to be seasoned before use.

TUTANKHAMEN'S TOM

"THE Pyramids and other Tombs o Egyptians" was the subject of a le by Sir Banister Fletcher at the Ce School of Arts and Crafts on Wedn last. With many interesting lantern illu tions he described the houses of the Egy dead, from the "mastabas," or small o buildings evolved probably from the p toric grave scooped in the sand, to the cut tombs at Beni Hasan, with their octagonal columns, and the great pyra at Gizeh, near Cairo, and elsewhere. remarkable productions of Egyptian ar sulted from their desire to preserve the mified bodies till they should be re-inha by the soul. The Great Pyramid of C is 482 ft. high and covers 13 acres— nearly as large an area as Lincoln's Fields— and this and the Second and Pyramids are all nearly 6,000 years old. lecturer illustrated the innermost recesses the first-named pyramid, and described mysteriously guarded approaches to them

The lecturer also referred to the enig Sphinx of Gizeh, standing as sentinel o forgotten years which lie behind it, a the so-called "Temple of the Sphinx" by, with its very ancient construction.

The lecturer then described the ron tombs of the Kings at Thebes, on the we bank of the Nile, opposite the better-k Luxor, and their remarkable plannin chambers and corridors sloping back int heart of the mountains. Of greatest in among these at the present time is the of Tutankhamen, son-in-law of the "h king" Amenophis IV, who adopted the of Akhenaton. The entrance to this whose discovery has excited such wides revival of interest in Egypt and its lif history, is below that of Rameses VI. leads by a staircase to several char packed with the most remarkable treas and clearly shown in the lantern view Banister described. He concluded by remarks on the burial rites of the Egypti

ITISH EMPIRE EXHIBITION, WEMBLEY.

YEAR ago the site of the British Empire bition at Wembley, covering some 130 , was open country except for the Stadium ng completion and the plant and litter in ection with the erection of that structure n were lying about. Now about half of the s covered with buildings either roofed in or irse of roofing.

will be seen from Fig. 1, the main entrance on to a formal garden with fountains, gh which the main avenue, with the Palace ndustry and the Machinery Hall on either leads to the Stadium. Entrances to these ngs are placed on the main avenue, but are alternative covered ways leading to from the entrance. These covered ways, d of concrete columns in pairs tied at the ith reinforced concrete beams, are seen in ustration on either side of the garden. The ings to the left and right of the main ie are the Palace of Industry and Machinery respectively, the largest buildings in the bition.

ne idea of the vast extent of the Palace of try and the Machinery Hall may be gained Figs. 2 and 3. The structures are entirely crete and steel, with the roof partly glazed artly filled in with asbestos cement sheet- The concrete columns were poured *in situ*, the curved members forming the arches upporting the roof were cast on the floor e building and hoisted into position. The s a reinforced concrete raft extending over hole of the area. The roof trusses of the aisles seen in the middle of the illustration steel, but for all the subsidiary aisles pre- einforced concrete trusses are used; these e seen to the right of Fig. 2. All internal ions and curtain walls are of breeze blocks thin face of a mixture of cement and sand. are made by hand in wooden moulds on or of the building (see Fig. 3), and stacked required.

arge number of concrete flag masts are yed on different buildings. The weight of ast is taken on a lion's head corbelled out the face of the wall and they are kept it by passing through a ring bonded into the wall about 4 ft. above the lion's head; both the lions' heads and the stays are cast in concrete.

TOWN PLANNING AT GLASGOW.

MR. JAMES MACAULAY, F.S.I., A.M.T.P.I., last week gave his presidential address to the Royal Technical College Architectural Craftsmen's Society. The main subject treated was town-planning, and after outlining the history, objects, Acts, authorities, and powers, the lecturer gave the practical application to Glasgow.

The report of the Glasgow Medical Officer of Health in the beginning of 1913 was, he said, the means of the Corporation determining to prepare town-planning schemes, so that in October of that year they passed resolutions for two areas (1) lands at Kennyhill and Riddrie, situated wholly within the area of the Corporation; and (2) lands in the districts of Kelvinside, Temple, Jordanhill, Broomhill, Whiteinch, Scotstoun, Yoker (East), Drumchapel, Scotstounhill, and Knightswood, situated partly within the area of the Corporation, partly within the area of the local authority for the County of Dumbarton, and partly within the area of the local authority for the County of Renfrew.

The Kennyhill and Riddrie scheme at the time of its first consideration included 106.1 acres, of which 62.6 acres in the Riddrie area were owned by the Corporation, 27.5 acres of Blackhill Estate, 15 acres of the Kennyhill area, owned by the Corporation, and 1 acre in small plots belonging to others. Shortly afterwards the Corporation purchased the Blackhill Estate, and the scheme was approved in February, 1919. That area was one of the sites selected by the Corporation for a housing scheme, and was fully developed.

The second scheme proposed as the Great Western-road scheme was chiefly considered as likely to be one of arterial roads. The total area extended to about 6,580 acres. A Joint Town-Planning Committee was subsequently appointed with powers to prepare a skeleton scheme embracing provisions for main arterial and traffic roads and bridges, widening of existing roads, definition of building lines, heights of buildings, general densities of buildings in land units, location of works areas, location of large and regional open space, definition of new docks and wharves, railways, sidings, &c., tramway routes, systems of main drainage, water supply, gas supply, and any other feature which might be of general concern and interest to the area as a whole.

The Joint Town-Planning Committee for the Western Areas was prepared to submit its scheme to the Scottish Board of Health last year, but through the urgency of the work connected with State-aided housing schemes and shortage of staff it had been unable to undertake the examination of the proposals, and there the matter rested. It was significant, however, that development of the area included in the proposals of the Western Area scheme must proceed, and it was to be presumed that that development was along the lines suggested by the Joint Town-Planning Committee even although the scheme as a whole was in abeyance.

For instance, the Admiralty had to build oil tanks at Dunotter; Messrs. Birrell wished to extend their works; Glasgow determined to proceed with the 140 ft. wide boulevard from Anniesland towards Bowling; the Board of Agriculture to give off small holdings on part of the lands required for that boulevard; Clydebank to provide work for the unemployed in road and street works in their portion of the scheme; and now there was Glasgow's great enterprise in the formation of the new western suburb at Bankhead which, together with Knightswood and Cloberhill, would be laid out for 3,300 houses.

Except for those two schemes Glasgow might be said to have made no progress in town planning. That seemed to him to be particularly unfortunate, because development was being forced upon her, and although it might be guided aright in compartments by housing schemes, and State-aided private enterprise, public utility societies, slum clearances, arterial and secondary roads, and all the contributory departments of public health, besides the growing speculative building and the slowly-growing industrial works extensions, there was a great lack of co-ordination and that high level of planning only to be had by means of town-planning schemes.

NNE HATHAWAY'S OTTAGE, STRATFORD-ON-AVON.

DITH SHAKESPEARE, daughter of William espeare and Anne Hathaway (twin of net Shakespeare), was born in 1585. he age of thirty-one she married Thomas ney, vintner, at Stratford-on-Avon. While ratford, Judith and her husband lived for y-six years at 1, High-street. At that time, house in which Judith Shakespeare lived, first Elizabethan state, was a half-timbered ing with overhung eaves and gables, and the face of oak and plaster. In writing of this e, the weekly *Graphic* says :—

t is reasonable to conclude that the poet d his daughter there during the ten ining weeks of his life after her marriage. inly, Judith would be visited here by her Susanna, who had married the humourless Hall, and by their daughter, who became Barnard. Equally clearly we can descry oet's widow as a specially welcome and ant guest at the High-street house, a few away from her own.

Early in the last century, Corporation ates decided to 'restore' it, as they and the deed was done. A record of shows that some years before the Council xpended £600 on this philistine enterprise ; during the recent work it was discovered the old eaves had been cut away. One ularly interesting section of the interior dith's cellar and the basement once used e town lock-up. Under this roof were the three children of Thomas and Judith ney, and here they died.

uinney leased the house from 1616 to He seems to have prospered here for time, becoming a town councillor in 1617 hamberlain in 1621-2 and 1622-3. After his affairs grew somewhat involved, and t Stratford late in 1652 for London, where months later he died. His widow survived February 9, 1661-2, and was buried in churchyard near her sons. Her twin er, Hamnet, the poet's only son, had died eleventh year, and with Lady Barnard oet's only granddaughter), the direct xpired.

is eminently fitting, therefore, that this ng should be made to preserve some of ginal form, as known to the Shakespeares, ne public-spirited act which has rescued it ly from a state of very conspicuous ss and made it to live again, is worthy iversal recognition. A mask of stucco, for many years concealed and distorted udor façade, is now removed, and we a restoration ranking in importance after lace and the birth-house in Henley-

se responsible for the restoration work Messrs. W. H. Smith & Son, booksellers ewsagents, the present tenants of the es. The Stratford-on-Avon Corporation owners of the property, which forms part Guild Estate. Half the rent of the ng goes to the King Edward School, as in the days when William Shakespeare schoolboy there. The restoration was l out under the direction of Mr. Guy rton, Lic.R.I.B.A., of the firm of Messrs. n, Pemberton & White, architects, rd-on-Avon. The restoration was carried n "Atlas White" Portland cement . Our illustration is given by permission *Graphic*.

New Bristol Housing Schemes.

Bristol Housing Committee has prepared rt for presentation to the City Council re- ending a scheme for the building of ano- 500 houses, and to proceed with the lay- sites at Bedminster Down, Horfield, well and Shirehampton. Arrangements so being made for building working-class ngs, and to sell them to the tenants by a of extended payments.

BRISTOL TOWN PLANNING CONFERENCE.

A CONFERENCE of members of the Bristol Town-Planning Committee and representatives of local authorities in the surrounding district was held at Bristol on October 11, under the presidency of Mr. G. L. Pepler, of the Ministry of Health.

The Lord Mayor gave an address of welcome.

The Chairman said one of the objects of joint town planning was to maintain the identity of the parts, safeguarding that which should be preserved, keeping the right balance between the parts, and fostering and co-ordinating their functions, so that the most might be made of the resources of the region and it might develop on the most economic and healthy lines. In view of the urgent need for economy, he thought the fact should be emphasised that through town planning waste might be avoided and economy achieved. The principal economic object of town planning was to plan out all developments, so that whatever money was subsequently spent in the locality, either public or private, should be put to its most productive use and not wasted on mutually destructive and ineffective objects, as had so often been the case in the past. After pointing out the mistakes which had been made in the past through lack of definite plans, which had resulted in much inconvenience and expense, he said the right method was to treat as one an entire economic and geographical unit, and plan so that each component part might develop to the full and to mutual advantage, and at the same time might enhance the prosperity of the region as a whole by enabling the most to be made of all its resources, and the best possible conditions obtained for all its inhabitants.

After discussion it was decided to form a Joint Town-Planning Committee for the area, to include the county boroughs of Bristol and Bath and the surrounding urban and rural districts, such committee to consist of delegates from the local authorities in the following proportion :—Each county borough, 2 members ; each borough, 2 members ; each urban district, 1 member ; each rural district, 1 member ; the withdrawal of any one or more constituent councils from membership not to invalidate the appointment and continuance of the committee. It was agreed that officials of County Councils should be allowed to attend the meetings of the Committee, and also any officials of any local authority represented on the Committee, but such attendance to be in an advisory capacity only.

It was also decided that the County Councils of Gloucestershire and Somerset should be invited to send a representative to attend the meetings, but such representative would not be capable of being appointed a member, or of voting. Representatives of interested trade, professional, technical, business or other organisations may also be invited to attend the meetings at the discretion of the Committee.

British Empire Exhibition.

The authorities of the British Empire Exhibition have considered the question of awards, and it is reported that the general feeling seemed to be that, having regard to the purely British character of the Exhibition and the absence of any element of international competition, it would be in the best interests of the Imperial objects of the Exhibition, as well as of the exhibitors themselves, to abandon awards on a competitive basis. If the general opinion is against awards steps will be taken at once to regularise their abandonment. If this be found impossible the awards in each particular section will probably be made by a jury appointed by the exhibitors in it. Should the new policy be approved, a commemorative medal will be presented to each exhibitor.

Anne Hathaway's Cottage, Stratford-on-Avon.

THE BUILDING TRADE.

THE TRAINING OF OPERATIVES IN THE BUILDING INDUSTRY.

BY T. P. BENNETT, F.R.I.B.A., Head of the Department of Architecture, Surveying and Building, Northern Polytechnic, London, N.

The Training of Operatives.—The sources of supply and the training of skilled operatives are problems which are causing grave concern to those who are intimately acquainted with present conditions in the building industry.

Lack of an Adequate Supply of Craftsmen.—In the last few months there has been a slight revival of activity in building and immediately skilled men, particularly bricklayers, joiners and plasterers, have become unobtainable. It is common knowledge that indentured apprentices have steadily decreased in numbers in recent years, and as the trade organisations at present tend to view with disfavour the progress of a man from a labourer to a craftsman, there can be no doubt that the number of craftsmen available is being steadily depleted. The seriousness of the situation becomes evident when building schemes are held up, labourers are unemployed, and building work is consistently cancelled or withheld from the industry because of the slow progress of a building and the length of time during which capital is locked up in uncompleted work.

Education and Training in the Past.—In order that some attempt may be made to solve the problems involved in this matter it is necessary to investigate past conditions of work and conditions of labour and to compare them with those prevailing at present. The method of training craftsmen for many generations has been by means of apprenticeship, and the fact that as a system it produced a high standard of work is sufficient to create a powerful tradition in its favour.

Industrial Conditions.—The conditions under which it flourished were (*a*) long hours of labour, (*b*) a comparatively slow rate of output (*c*) low rates of pay.

Relations between Skilled and Unskilled Men.—In order that a true perspective of apprenticeship as a modern method of training may be obtained, it is necessary to visualise the conditions of the building crafts of this country in previous generations. In the first place the community was not collected in large towns to the extent which prevails at present, and in the second place there was a much greater measure of contact and sympathy between individuals. These factors created a personal interest between skilled craftsmen and embryo craftsmen, which resulted in a willingness to spend time in training, not in evidence at the present.

Demand and Output.—The flow of work into a particular workshop was much more constant than it is now, largely because the speed of modern building and modern life had not been reached and the work as it arrived was automatically spread out. This created more stable conditions in the industry, and in individual workshops, as a result of which the number of men employed in a particular shop was more constant and the serious slumps and intense booms which are now experienced did not exist. In addition to these inherent elements of stability were the external features enumerated above, viz., long, and at one time almost unlimited hours of labour, accompanied by an output of which the speed was immaterial.

As a result of these conditions building trade employers raised no objection to skilled operatives or foremen using a certain amount of time teaching an apprentice. Any time so lost was made up as a matter of course by the man remaining a longer time to finish his task, and was further favoured by the fact that if this incident of teaching delayed the progress of the building it caused no comment either by the employer, architect or prospective user of the building. To these factors must be added low rates of pay which did not make the engaging of additional workmen a serious matter.

Modern Conditions.—It is necessary at the outset, therefore, to realise that the conditions of work in the industry at the present moment differ in essential factors from conditions that prevailed even so recently as 50 years ago, and they differ still more seriously from those which prevailed up to the eighteenth century, when the system of Guilds and apprentices flourished with its greatest success. It must also be realised that much of the anxiety for producing work in a given time falls upon the general foreman in large works and that it is upon these men that the responsibility of teaching apprentices rests. The result is that the foreman chooses the line of least resistance, confines himself to his work and refuses to take apprentices. We may summarise these factors as follows :—

Different Methods of Training Craftsmen.—(a) Short hours of labour leave little time for responsible hands to spend in teaching boys, apprenticed or otherwise ; (b) the responsibility thrown upon foremen and charge hands to produce work in the shortest possible space of time adds so much to their difficulties that they will not be saddled with the necessity of spending time teaching unskilled or semi-skilled operatives ; (c) increased wages have increased the cost of the work and have still further eliminated any possibility of allowing a portion of the time of skilled men to be absorbed in teaching ; (d) to these factors must be added conditions which fluctuate to a much greater extent than was formerly the case and which, therefore, make it impossible for an employer to bind himself to pay and teach an apprentice for a substantial term of years.

Chief Reasons of Fluctuations in Modern Building.—The fluctuation of work in modern building is due to many factors, of which three have, in recent years, come into prominence :—1, Legislation ; 2, the condition of Europe ; 3, the present size of individual buildings.

The Erection of the Larger Modern Buildings.—It is unnecessary to enlarge upon the first two of these points, which have been sufficiently in evidence in the Press and elsewhere. The third point is a factor which is not, perhaps, fully realised. Modern buildings tend to be erected by communities such as Municipalities, Companies, Co-operative Societies, Government Departments, &c., and this fact, together with the development of steel and ferro-concrete construction and the increase of land values in town areas, has meant that individual buildings of considerable extent, each absorbing a large amount of labour, have become a commonplace of building instead of an exception. As a result of this increase in the number of larger buildings to be erected, an individual firm may receive one or more extensive contracts which entail a substantial increase in the number of operatives in their employ. Their success in obtaining contracts may not be repeated at regular intervals and the same firm may find that the number of their operatives will fall substantially in other periods.

The fact that such buildings absorb a large amount of capital means that substantial sums of money are standing idle during the progress of the work with consequent loss of interest, and this is still another factor in causing the speeding up of erection. As a result of these essentially modern factors in building, firms can no longer gauge, with the same accuracy, the average number of men whom they employ, they cannot, with confidence, take the same proportion apprentices, neither can they undertake to wages to a large number of apprentices periods of five to seven years, during which amount of work passing through their shop quite an unknown quantity. In the case small and medium-sized firms, these factors aggravated, and they refuse to undertake to men with so great an uncertainty in front them.

There appears to be almost universal agr ment upon the fact that the existence of a or seven years' indenture is a definite almost insuperable barrier to the engagemen apprentices ; only the largest firms will cons such possibilities and even if these firms t a substantial number, the proportion of app tices to the total number of operatives enga in the industry is still insignificant.

Migration of Skilled Men to London.—Lon is apparently less fortunately placed than ot centres, because, for many generations, the r of pay have been higher than in any other p of the country, and the best men in the coun districts have consistently migrated to capital. The result of this has been t London employers have relied for their supp of skilled labour more upon migration than u the training of apprentices. Recently, rate wages have been fixed for zones and cert (A) towns have been created which have ra of wages similar to those in London. It perhaps, too early to make any definite st ment upon the result of this system, and, a is already proving somewhat unfair to Lon operatives, it may possibly be revised in the too distant future, but the opinion may hazarded that it will result in keeping ski men away from London. Those in the ne bourhood of Birmingham, for example, may migrate to Birmingham rather than take longer journey to London. Further, it admitted that the cost of living in Lon(including heavy daily travelling expenses considerably greater than in provincial tow and therefore the London operative, although may get the same wages as some of his provin colleagues is worse off because his expenses greater.

If these factors can be completely stantiated they tend to show—(1) apprenticeship has many difficulties w never previously existed ; (2) that it is extrem doubtful whether this method of training ever become the universal gateway for en into the building crafts which it undoubt has been for many years ; and (3) spe difficulties surround its revival in London.

The Attitude of Employers and Operative the Apprenticeship Scheme.—With regard to attitude of employers and operatives respecti towards the apprenticeship scheme, it is follows :—(*a*) The employers are divi between (1) a small minority who are extrem interested in the crafts as such, and believ the tradition of apprenticeship ; they furthermore, prepared to make any reason sacrifice that may be necessary to reinstate and (2) the almost overwhelming majority consider that it is financially impossible for th to undertake to pay apprentices for a pe during which the amount of work they have in hand is quite unknown. The claus the present scheme which provides for attendances of apprentices for one day a w at a technical school is, from a business p of view, an added difficulty, and is only car out by the enthusiastic minority referred previously.

(*b*) The operatives support the sch universally. (1) They honestly believe tha is the best method of training craftsmen possibly, in fact, the only method ; (2) t consider the restrictive character of an indent an asset.

The time has arrived when a Commi should be set up to deal with the whole quest of the education of operatives, and to investig

sible means by which this education might obtained. The problem is difficult, as are new solutions to matters which are of age- importance. It may be that a new system pprenticeship can be devised, that labourers be allowed under certain conditions to me craftsmen, or that technical schools , in future, be responsible for preliminary ning just as architects are now trained in ols where formerly they were indentured. not a question of overthrowing apprentice- , which is still of very great importance, will continue to be a part of the organisation rge building firms. It is a matter of finding eans of supplementing the number of tsmen who are being trained by this method. his connection it is important to consider effect of the elimination of apprenticeship out the substitution of some other definite od of training.

he War and Unskilled Labour.—The war ided an invaluable object lesson. In its days operatives in building were seriously ced in numbers, and in the later stages a amount of building work was put in hand. result of this late development of building ities numbers of practically unskilled men nted themselves at works offices for gement as skilled operatives. In most they were engaged and were admitted to bership of their respective Trade Unions. easy to understand that a man may, out much difficulty, learn one operation rpentry, joinery, plumbing or bricklaying. may not be able to do it well, but in the ce of any better craftsman he gets engaged. obvious, also, that at the earliest possible ent such a man is discharged, and the ntage of unemployed in the industry is by increased. A certain amount of this of thing is again occurring in building, and discovers that the tendency towards alisation, which is a feature of all industries, ing aggravated, the knowledge and skill of smen being so exceedingly limited.

an instance of this, a leading master builder d a short time ago that special carpenters to be employed to make centering for rced concrete work and that when this was finished and no further centering was able the men were discharged. To anyone ssing a knowledge of the ability which the d craftsman can readily obtain, it seems lous that there are such special features reinforced concrete that they cannot be understood by men capable of doing any kind of carpentry work. It is evident the result of lapse of apprenticeship as a m of training and a failure to substitute lternatives will be that in boom years large bers of operatives will come into building are almost entirely unskilled, that at the est sign of slump these men will become ployed and, indeed, unemployable, and therefore not only will the level of crafts- hip fall but the burden on the country will finitely greater than it need be. It is cer- that the members of the trade unions fail ppreciate this result of the restriction of ition, and training facilities, or the entry the trade of skilled men. The absence of ing is a menace, not only to the efficient ct of the industry, but also to the nation whole.

portance of Building.—Building is one of most important industries in the country n times of great social change it is essential building should be facilitated in every ble way. New buildings are required to ly with advancement in methods of con- tion and revolution in current ideas about al and artificial lighting, ventilation, ne, economic organisation, mechanical ances, lifts, &c.

e importance of building cannot be denied. need for training is beyond doubt and the ion therefore arises as to the best method taining a live system of education. In rst place apprenticeship is accepted almost rsally as theoretically the best method of ing. In practice, however, the number of ntices employed in building work has ily declined for the last 25 years. This decline has been progressive, and is assuming quite serious proportions. After the war determined efforts were made to re-introduce apprenticeship on an extensive scale and to revive interest in the system as a part of the practice of the industry. The effort met with temporary success of a partial character, but it was in the nature of a flash in the pan. This interest in apprenticeship as such coupled with its progressive signs of practical failure suggests that it is out of touch with modern conditions and the possibility must be faced of its eventual disappearance as a means of entry to the crafts. Before any efficient substitute can be found the opinion of all responsible parties must be obtained and the object of this paper is to endeavour if possible to ascertain whether :

(1) Conditions all over the country show that there has been the same decline in apprentices as has occurred in London.

(2) Whether responsible employers consider the revival of apprenticeship upon a large scale is probable in the near future.

(3) What alternative means of training can be suggested to either partially or wholly take the place of apprenticeship.

Boys in Building Works under Present Conditions.—Briefly, the position is this : between the ages of 14 and 16 boys are of no great value in building works, and under present conditions they tend to run errands, make tea and perform other odd jobs properly belonging to labourers. Between these ages, therefore, they are not a serious loss to the industry ; on the other hand, their minds are in a pliable condition and under skilful guidance they can be made to develop remarkable progress and quite a high standard of skill. If they enter the industry at the age of 16 or 17 with some efficient craft training behind them, they are able to do useful work almost immediately. It might be possible to arrange for craft schools to give this preliminary training. It is obvious that any scheme adopted must be one of considerable magnitude and will not be limited to London, although possibly in London the need is greater than in any other place in the kingdom for the reasons already stated.

Condition of Payment of Operatives.—Wrapped up with this question of training is the question of conditions of payment in the industry as a whole, because so long as men are faced with a low wage during booms, with a short week and loss of time in bad weather, together with the almost entire elimination of their wages in periods of slumps and bad weather, they cannot appreciate the facts that many additional operatives can be supported by the industry. In discussing any scheme of payment it must be borne in mind that building is dependent upon general financial prosperity compared with the cost of building, because building represents the sinking of capital and can only proceed when the return is relatively great. Building, therefore, will always be a fluctuating industry.

Summary.—The salient features of this short résumé may be summarised as under :—

(1) The apprenticeship scheme is extremely unlikely to succeed or to experience any extensive revival, because it does not conform to the conditions which prevail in the industry at present.

(2) The existence of an active apprenticeship Committee is essential to the well-being of the industry.

(3) That the absence of an adequate system of training and method of entry into building will be followed by a disastrous inrush of unskilled and semi-skilled men during periods of boom and, consequently, an exaggerated unemployment list on the slightest suspicion of a slump.

(4) That some system of payment must be put into force to remove the difficulties that many operatives experience at present in obtaining adequate remuneration for the number of years they spend in attaining the level of ability demanded by their work.

(5) That the time is ripe for a full investigation of all possible means of training operatives, and that to this end the opinion of both employers and operatives must receive the fullest possible publicity.

COLONEL TROLLOPE AND THE HOUSING ACT.

Speaking at a meeting of Cobham (Surrey) Parish Council on Tuesday last week, Colonel G. H. Trollope said that, so far as getting houses or cottages for the working-classes, the Housing Act of 1923 might as well be non-existent.

The Minister seemed to be under the impression, said Colonel Trollope, that because it had been found possible, in certain favoured localities, for builders to erect houses and sell them at a small profit, similar conditions would prevail in all cases. The localities where those operations could be carried out, which the Minister seemed to think possible generally, were where the land had been acquired by the local authorities, and roads and sewers were constructed, as well as gas and water mains laid. Those localities must also be where there were adequate facilities for getting to London, or other place of employment, at reasonable cost, because it was found that in the majority of cases the purchasers were not actually operatives, and in any case must be able to command a first instalment of the purchase money, the balance being advanced by the local authority and repaid in the shape of rent spread over a term of years.

In the case of Malden a large number of builders, he understood, were actually erecting houses in anticipation of getting the £75 grant, which, had it been received, would have enabled them to sell the houses at that amount less than otherwise they could. However, for the artisan or labourer such a programme was quite out of the question in the majority of cases—those people seeking houses at a rental. It was the business of a builder to build, not to act as a financier ; and, therefore, unless such houses as were required were provided by local authorities, or public utility societies, they would never be built. With the present cost of materials and labour, in addition to the expense of acquiring land, making roads and sewers, and laying gas and water mains, an economic rent could not be expected unless the builder were aided by the subsidy provided for and contemplated in the Act of 1923. The whole trouble had arisen because of section 2, clause 2, which gave the Minister power to withhold the subsidy unless, in his opinion, houses could not be erected without assistance under the Act.

It was decided to await the result of a request for a conference at the Health Ministry.

MEETINGS.

Tuesday, *October* 23.

Liverpool Architectural Society.—Mr. A. N. Shelley on "Control of Building by By-Laws and other Forms of Local Regulations." At 13, Harrington-street.

Incorporated Institute of British Decorators.—Mr. F. De Jong on "Empire Style in Decoration." At Painters' Hall, Little Trinity-lane, E.C. 7.30 p.m.

Wednesday, *October* 24.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Temples, Obelisks, Dwellings." At Southampton-row, W.C.1. 6 p.m.

Builders' Association for Pembrokeshire.

At Haverfordwest on Saturday there was a representative gathering of Pembrokeshire county master builders and building trade employers to consider the formation of an association of building trades employers for the county. Mr. J. O. Morgan, J.P., Prendergast, Haverfordwest, was elected to preside over the meeting, which was addressed on the question of an association's advantages by Messrs. W. E. Goodridge, Neath (President of South Wales Federation of Building Trades' Employers), E. W. King, Newport (Mon) (Auditor of the National Federation), David Davies, Swansea (President, Swansea Builders' Association), and D. Anderson, Aberavon, the Technical Adviser to the South Wales Federation.

It was unanimously decided to form a Pembrokeshire Association.

BUILDING TRADE WAGES AND THE PUBLIC.

By "SURVEYOR."

Public opinion on this question is becoming confused by the reiterated, conflicting arguments of the various interested parties. Public sentiment has hitherto leant to the side of the file of the industrial army. It has desired better conditions for manual workers, represented, of course, by higher wages, which are the foundation fact of all amelioration.

Now, this has evidently come into being of recent years. The working man has had his hours of work reduced and his pay very much increased. His scale of living has been revolutionised. Clothes, food, amusements and spare money for luxuries are obviously all enjoyed on a scale that the present mechanics' or labourers' parents would not have dreamed possible for them to attain. Even in country villages, where wages and the style of living were formerly on a lower scale, at the present time even external appearances show that much more money is available in every family. This has not only been the case during the war boom, but has persisted since lean times have set in for the building as well as other trades, and unemployment has become endemic.

At the same time public assistance for the working classes has become widespread. Education is free to all; scholarships are given gratuitously to selected pupils; medical attendance, boots and breakfasts granted to necessitous children, and conveyances provided for weaklings. The expense of rearing children has been largely lifted from parents' shoulders. At the same time, for the workman himself, doctoring and out-of-work subsistence are largely assisted from the public purse or from employers' funds, and enormously augmented by Boards of Guardians.

The cost of living is all the time coming down, slowly, it is true; but the problem of reduction is complicated by the increased wages paid in course of production, and these have been maintained by combinations of workmen in all trades. Further, rents of industrial-class houses have been legislatively restricted at a low level, at the expense of property owners, for the benefit of working-class tenants, and the latter have largely taken advantage of the shortage of houses to make heavy profits out of their homeless brethren by subletting rooms at high prices. In a word, during and since the war all classes, especially wage-earners, have enjoyed unwonted prosperity, and generally have spent their whole income without reckoning the certain lean times to come.

Now the inevitable backward swing of the trade pendulum finds us all shocked and discontented because we cannot maintain our raised estate. Many trading companies have failed, trade profits have fallen, and subsidies to unemployed, war pensions and profligate public expenditure and mismanagement have burnt the candle at both ends. Foreign competition has hit the export trade by means of depreciated exchanges and the low wages paid to workmen abroad. Nearly all trades have had, unwillingly, to submit to reductions in wages and profits to keep their heads even spasmodically above water—all but the building trade, and, possibly, a few other occupations, sheltered from the keen blast of foreign cheap imports. Slight reductions, proportionate to the lower cost of living, have certainly been made in the building trade, from the inflated wages paid during the feverish boom after the Armistice, when politicians sang pæans about everlasting peace and future El Dorados, and when the lavish outpouring of public taxation demoralised all building ranks in the effort to make up the shortage of dwellings.

This deficiency was plainly and obviously aggravated by the inflation of building costs, preventing both the public provision of houses, except at a ruinous loss, and at the same time effectually stopping all private speculation for profit. This same prohibitive expense checked, and still checks, the placing of contracts, except some for Government or public authorities, where expense is not considered or it is desired to mitigate the miseries of unemployment. In addition, a few luxury trades, supported by the extravagant habits of the public, can afford the outlay on new works and offices for purposes of advertisement. If the "Lists of Tenders" are carefully scanned it will be seen that these two classes cover the bulk of new business.

Under these untoward circumstances building contractors have naturally pressed for a reasonable reduction of wages, in order to stimulate building, and to diminish the lamentable amount of unemployment. After months of haggling, both sides agreed to refer the dispute to independent arbitration by a higher legal expert, entirely immune from trade interests. The consequent award decreed a small reduction of wages in the higher-paid towns and a smaller decrease in the cheaper country districts. The reductions were disappointing to the farthest seeing men in the trade, who desired to nourish the golden goose to induce a more plentiful supply of eggs. In some country districts the halfpenny decrease awarded was so trifling that builders hesitated to stir up strife by enforcing it, and the old rate is still paid.

Now, however, the highest scorers in the team are disputing the umpire's decision, contrary to all the rules of the game, on the ground that it reduces them to starvation wages. This, obviously, is a mere flower of speech, as in many other trades, for instance, shipbuilding and engineering, wages of skilled mechanics, and even exactly similar branches to some employed in the building trade, such as pattern-makers and joiners, were about two-thirds only of the standard of "building mechanics." Further, in these great industrial centres the cost of living and general scale of wages are higher than in London, and it is in the building trade that high wages persist.

Now, when good workmen, living in highly civilised centres, are managing to live comfortably without complaint, it is incredible to believe that building-trade men cannot make both ends meet on much better wages.

Again, for building mechanics to cry, "We are starving, and we won't agree to lower our pay," and yet, at the same time, peevishly to refuse to work longer hours, although paid at higher rates for overtime, rather smacks of the spoilt child. Surely they should feel a little consideration for the general wages-payer and bounty-dispenser, the public. They appear to overlook that all payments come out of the general purse, either by direct payments or by public taxation. Many people appear to think subconsciously that the Government find all public subsidies out of some mysterious hidden reservoir, as a conjurer produces a golden apple out of a mystery hat.

If the above appeal is not strong enough, have the men no sympathy for their hundred-thousand fellows out of work in the trade, nor for the million lacking a house to live in? Is the rest of the community expected to tax itself to pay further largesse, both in high wages and in bounties, to a class naturally sheltered from the blast of foreign competition? Is it generous for this protected section to cry out at the proportionate reduction of pay as an "insult"?

Building operatives have for generations built up a reputation for sanity and moderation of views, and should surely now be chary of encouraging small sections to endanger their good name. On the other hand, reasonable complaints of uncomfortable or inadequate messrooms must certainly be investigated and remedied by the employers' associations, not only to satisfy public sentiment, but still more to produce a friendly and satisfied feeling amongst the men. Common sense, if not generosity, ordains this decent provision, in order to keep the working army in good fe and heart. Only mean minds would re such reasonable treatment of one class another.

In the settlement both sides must sh moderation and good feeling to ensure a las peace and to hearten up the building force attacking the problems of unemployment, trade and lack of housing. All minor questi will then soon settle themselves.

PRICE OF BUILDING MATERIALS.

The report for the month of September the Inter-Departmental Committee appoin to Survey the Prices of Building Material as follows:—

"The position remains practically unalte since the date of the last report (Augu As regards the more important materials, si August there has been an advance of £1 standard in carcassing timber at Willes and £1 10s. per standard in joinery timber Birmingham. On the other hand, the spe purchases of the London County Council ha been made at a price of £22 7s. 6d. a sta as against £25 7s. 6d. paid during Aug It should, however, be stated that this Aug price was specially high for a local rea namely, that the London County Council h to depart from their ordinary source of sup on account of the dock strike. The co parison would therefore be better made w the July price of £21 7s. 6d.

"In the case of the other materials, a gene advance in lead, varying from 10s. to £1 a ton is reported from Bristol, Leeds, Newcast on-Tyne, Swansea, Hampshire, Edinburgh, a Glasgow.

"Apart from these items, there have been o a few small fluctuations of minor importa in such materials as, for example, turpent and linseed oil, but there are no apprecia changes, and prices generally remain steadi the same level as during the previous month

MIDLAND FEDERATIO OF BUILDING TRADE EMPLOYERS

By invitation of the Northampton Ma Builders' Association, the Executive Council the Midland Federation of Building Tr Employers held their quarterly meeting Northampton, on October 11. Those pres included Mr. W. Sharrat (Wolverhampt President; Mr. G. A. Hewitt (Leicester), Vi President, and also President of the Leices and Rutland County Federation; and Mes F. G. Whittall, S. Guy Sapcote, S. F. Swift, a A. J. Bowen (Birmingham); W. W. Webst H. A. Glenn (Northampton); C. S. Kersh (Burton-on-Trent); G. Sandy (Stafford); Powell (Wolverhampton); J. J. Hicken (Will hall); P. Bow, J. Stimpson, N. Hopewell, C. Gilbert (Nottingham); G. Knight (Ketterin W. O. Chambers (Leicester); I. W. Wooto (Alfreton); T. W. Youngman (Long Eato R. Streather (Sutton Coldfield); G. Coo (Nuneaton); A. Parker (Lincoln); J. Basw (Sedgeley); H. T. Golding (Dudley); W. Penn, W. Jones, W. H. Jones (Coventry); Kendrick (Walsall); S. Jackson (West Bro wich); I. W. Bowen (Leamington); R. Turnbull, Organiser; and F. W. Amphl Secretary. Members of the Northampt Master Builders' Association present wer Mr. C. A. Sharman (President), Mr. H. Archer (Vice-President), and Messrs. F. Smith, A. E. Green, C. H. Green, J. Wareing, L. Hawtin, J. Sharman, R. Busw W. Throssell, and A. Airs (Hon. Secretary)

THE NATIONAL FEDERATION OF HOUSE BUILDERS.

HALF-YEARLY MEETING.

IE half-yearly meeting of the National eration of House Builders was held on the inst. at Harrogate. The meeting was held e Council Chamber at the Municipal Offices, the delegates were welcomed by the Mayor David Simpson, J.P.). The Mayor said the housing difficulty was the outcome of 1909-10 Finance Act. He was a builder, s father before him had been, and before ar he used to build houses which he would f he could, and if he did not find a ready sale ould let them to tenants. All that had and, until the restrictions which had been sed upon owners of property were removed, could be no letting to tenants; the builder l only build for sale.

e Secretary (Mr. Norman McKellen, A.A.) read his report on the work of the ration during the past half-year. The ities of the Committee had been largely ed to the Housing Act, for the work led by constant watching the Bill as it went gh Parliament had been very great. The nittee had made repeated recommendations e Ministry of Health on the assistance which o be provided by the Act, and it was prac- y founded upon the Federation's plans, one important exception—the assistance to be dispensed by the local authorities ad of by the Government direct. The rnment were determined to decentralise ork, and the Act was drafted accordingly. e Federation was active in the question of nistering the subsidy, and was now in iation with the Ministry of Health as to the encing date for houses to qualify for the The Federation had approved a badge e by the members, and had also an attrac- prospectus which had been widely distri- . The President (Mr. H. R. Selley, on) had been appointed by the Minister of h to a Committee, which had been formed e purpose of advising the Minister on the ardisation of water fittings. There had a very strong attempt on the part of the Works' Association to get some very specifications for water pipes, cisterns aps, but, owing to the opposition of house rs, property-owners and others, the er of Health had formed a Committee to him before he took action.

H. R. Selley (London), in his Presidential s, congratulated the members on the sing amount of recognition which the tion had received from all quarters. were, he said, not only represented on the ty of Health Committee on Water Fittings, ere also engaged on a joint Committee he Surveyors' Institution and the Master rs' Association to consider local by-laws. l been invited as President to attend the ational Housing Congress to be held in where he had promised to give a paper using in England after the War. All this ition was gratifying, and would do the tion good.

brick shortage in the South of England adually becoming less acute, but the great was the cost of all materials, not only of House builders were only the vehicle on the cost to the consumer; whatever t, we had to hand it on, and he could not substantial fall in costs until there was abour available. There was a real short- labour in the two key industries, brick- and plastering, and it was due to the uilder having been out of commission for y years. He thought the trade unions be a little bit more relaxing on the ques- apprentices, and when there were more ere would be more houses built.

regard to the Housing Act, the house trade welcomed the Act when it was first passed. It was not perfect; but if it was carried out in the spirit in which it was designed it would provide many houses. The size of the house to rank for the grant was raised from 850 ft. to 950 ft. while the Bill was in Committee, and that extension was the acknowledgement of the Ministry of Health that the subsidy would apply to the working-class who did not carry a hod nor dig with a shovel. Their members set out to meet the need, and, although it was a difficult task, they and their architects had planned artistic, compact and convenient houses on the limited space of 950 ft. inside measurement. Not only did the members welcome the subsidy on behalf of their customers, they did more—they built many houses expecting them to qualify for the grant. Relying upon what both the builder and the local authority took to be definite advice from the Government to go ahead with their schemes, they consulted the local officials and fixed up their plans to fall in with the requirements of the Act, so that the customers should have the benefit of the subsidy. About the middle of August the Ministry dropped a bombshell on to the job by declaring that no subsidy could be paid on any houses the construction of which was commenced before the local authority had obtained the approval of the Ministry to the scheme.

Although the houses were in every respect eligible for the grant, if the builder in his haste to get on with housing had commenced too soon the subsidy was not to be paid. He had heard of a case where a builder had eight houses in course of construction and sold six of them to newly-married people; now there was to be no subsidy on these houses all six had been compelled to cancel their contract. He believed there were well over 1,000 houses commenced for the subsidy which were now barred out because they were started too soon. The Federation had been one of the first to urge its members to get busy, but now they had to tell everyone to wait and on no account to commence a house until the local authority had given a definite promise to find the grant. It was a serious misunderstanding, and would do a lot of harm to the working of the Housing Act. He was not without hope that in all cases where they could prove their *bona fides* there would be a way to an understanding with the Ministry.

The difficulty about the commencing date was not the only difficulty. Very few local authorities had obtained the sanction of the Ministry to their schemes. Their members were waiting, and they wanted to know quickly whether the subsidy would be given on certain types of houses or not. House-builders were like men in the dark, and, until the Government laid down a line to enable people to define what would qualify and what would not, they could not see daylight. The general idea was that when the limit in size was fixed at 950 feet inside measurement, that limit constituted the dividing line, and he still believed that it was the best and only line to draw. The Ministry wanted to draw some other line which would divide the working-class house, but the suggested limit of selling price would not work. The land cost anything from £50 to £1,200 per acre, and the house would vary from £600 to £800. It would be good value at the price. To fix the subsidy by the price would not do. The only guide should be the size, and he maintained that every house which came within the limit of measurement in the Act should be eligible for the grant and should be sold to a buyer at a fair market price giving him the benefit of the subsidy.

The administration of the subsidy was giving a lot of trouble. Various local authorities were imposing conditions which rendered the whole thing impossible. He had heard that in Liverpool they were issuing a specification to guide the builder in qualifying for the subsidy, a detailed specification of twenty or thirty foolscap pages, a specification sufficient for a County Hall, and they were only giving the Government subsidy of £75 per house. The whole thing was monstrous. This and other conditions imposed in other places looked as if the authorities had made up their minds not to give the subsidy in cases where it could be said that the house was anything superior to an imaginary working-class standard. There was a large and deserving class of people who looked to the Housing Act to get them a house, and they would be bitterly disappointed if there were unnecessary restrictions thrown in their way.

Mr. R. A. Costain (Liverpool) said that he was driven to the conclusion that the Liverpool Corporation did not want houses built by private enterprise. The subsidy even in the old days was unsatisfactory. Customers of his firm had been deprived of the subsidy because the houses were started a day too late; now they were unable to get it because they started them a week too soon.

Mr. J. Belton (Sheffield) said that the time-limit had delayed building in Sheffield, where some of the builders had started too soon, but were now told that the subsidy would only be paid on houses commenced before December 31. One never knew whether he was too late or too soon.

After an animated discussion, in which many members took part, the following resolution was carried unanimously, on the proposal of Mr. R. A. Costain, seconded by Mr. George Sadler (Nottingham):—

> "This General Meeting of the National Federation of House Builders strongly protests against the failure of the Ministry of Health and the Local Authorities generally (with some honourable exceptions) to administer the Housing, &c., Act, 1923, in such a way as to permit private enterprise to receive the assistance which Parliament intended to provide when passing the Act, especially in reference to the following points:
>
> "1. The withholding of the subsidy where the building of houses has been commenced (on the promise of Local Authorities) on the ground that construction was begun before the proposals have been approved by the Minister.
>
> "2. The failure to grant the subsidy on all houses which comply with the Government regulations as set out in the Act.
>
> "The meeting, therefore, urges the Government to indicate promptly and definitely what conditions are to be fulfilled in order to qualify houses for the subsidy."

It was also decided that the Minister of Health should be asked to receive a deputation on the administration of the subsidy.

At the afternoon sitting a paper on "Housing the Owner-Occupier," which had been prepared by the Secretary, was read by Mr. G. F. Darbyshire (Manchester). The paper outlined the various methods of selling houses by means of mortgages and repayment mortgages, and Mr. Darbyshire laid great stress upon the necessity for house-builders to study salesmanship, for the most successful builders were those who knew most about finance.

The next annual meeting of the Federation is to be held in London in April.

Concrete Houses for Edinburgh.

The Edinburgh Town Council has adopted a recommendation that a contract for thirty-six concrete houses shall be accepted by the city. The houses are to be on the pier and slab system, similar to those at Newcastle and Nottingham. Concrete houses are already in existence in various cities, and a deputation of the Corporation who inspected some of them recently reported favourably in respect of their appearance, comfort, and cost. The cost is £375 per house. The offer which the Corporation are recommended to accept is by the patentees of the system, Messrs. Airey & Sons, Leeds.

LONDON BUILDERS' FOREMEN'S ASSOCIATION.

Annual Dinner.

THE Second Annual Dinner of this Association was held on Saturday last week at the Holborn Restaurant.

Mr. F. J. Walton, F.I.O.B. (Messrs. Ford & Walton, Ltd.), President of the London Master Builders' Association, presided, and was supported by Messrs. F. Thorne, R. B. Chessum, G. M. Burt, E. J. Brown, A. B. Falkner, Major R. J. Holliday, A. N. Dove, W. W. Dove, S. Holloway, G. S. Roberts, and other members of the L.M.B.A.

The usual loyal toasts were proposed by the Chairman and duly honoured.

The toast of the "London Builders' Foremen's Association" was proposed by Mr. F. Thorne, J.P., F.I.O.B., Vice-President of the L.M.B.A., who said he realised the many difficulties that faced them from time to time, and the often impossible conditions laid down as to time for completion. He congratulated them, as a body, on the way they rose to and overcame the difficulties that confronted them. The builders looked upon their foremen as the captains of ships, while they (the builders) were the admirals engaged in the general direction and manipulation of the fleet.

Mr. W. Mitchell, President, L.B.F.A., in responding to the toast, said difficulties arose to be overcome, and he could assure the members of the L.M.B.A. that they could always rely upon the ready co-operation and assistance of the members of the Association.

The toast of the "London Master Builders' Association" was proposed by Mr. J. T. Mackie, Vice-President, L.B.F.A. He pleaded that in negotiations on trade matters the foremen's view-point should be sought and given consideration.

The Chairman, in responding, pointed out that the members of the L.M.B.A. did seek the views of their foremen, and drew attention to the fact that London was only one region of the National Federation and that all agreements were made by the National Wages and Conditions Council.

Mr. J. W. Lamden, Secretary, L.B.F.A., gave a brief account of the activities of the Association since its inception, and said that although the Association had only been in existence two years, the membership now numbered 360. He expressed his thanks for the help and assistance he received from the Director of the London Master Builders' Association and his staff.

Mr. E. J. Brown said it gave him great pleasure to know that the Foremen's Association had so far fulfilled its expectations, and he hoped for a considerable augmentation of the membership.

RATES OF WAGES.

MR. ARTHUR GEE writes:—

Sir,—I have been an operative in the building trade now thirty years, less a few years' unemployment. This unemployment I have always regarded as almost entirely due to inclemency of weather, which in my branch of the trade is unquestionably detrimental. I presume the same applies more or less to all other branches of the building trade. Therefore, I have always concluded that the winter rest was inevitable—until the last few years. Now it occurs to me that, if no better reason can be adduced for putting the shutters up for three months out of every twelve, it is about time the operatives adjusted their demands to season, instead of throwing themselves on the unemployment fund.

Presentation.

An interesting ceremony took place at the works of Messrs. James Gibbons, Ltd., St. John's Works, Wolverhampton, when a presentation was made to Mr. Paul Gibbons, second son of Mr. F. J. J. Gibbons, on the occasion of his coming-of-age. On behalf of the employees, Mr. Paul Gibbons was presented with a fitted suit case.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons'	Bricklayers'	Pl ter Labourers.
Aberdare	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Accrington	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Altrincham	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Ashton-under-Lyne	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Barnsley	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Barrow-in-Furness	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Barry	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Bath	1/4	1/4	1/4	1/4	1/4	1/4	1/4			1/0
Bedford	1/3½	1/3½	1/3½	1/3½	1/3½	1/3½	1/3½			0/11½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½			1/4
Birmingham	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½
Bishop Auckland	1/7	1/7	1/7	1/7	1/7	1/7	1/7			1/2½

✱OCTOBER 25.—**Stafford.**—Temporary Architectural Assistant required by the Staffordshire Education Committee. Mr. Graham Balfour, Director of Education, Architect's Department, County Education Offices, Stafford.

OBITUARY.

The death has taken place, at Black Heath, of Mr. John Dallow, a well-known timber merchant, builder, and contractor. For over twenty years Mr. Dallow was one of the representatives of the Rowley Regis parish on the Staffordshire County Council, while he sat as a member of the local Urban Council for his own ward without a break from 1898, occupying the position of chairman of that body in 1906. His other public duties included membership of the Dudley Board of Guardians, Rowley Regis Education Committee, and Upper Stour Valley Main Sewerage Board. He held the chairmanship of the latter authority for some years. He was appointed as a magistrate for Staffordshire in 1912. He was a member for years of the Birmingham and West Bromwich Master Builders' Association, and for three years held the chairmanship. He occupied the presidency of the Midland Centre of the National Federation of Building Trades in 1907, has been a member of the Executive Council of the Centre since 1898, and a member of the National Council since 1903.

THE CLASSIFICATION OF STEEL BY MEANS OF SPARKS.

IN connection with the testing of steel at the Northern Polytechnic Institute on a recent occasion, a demonstration was given by Mr. J. Reader Saul of the classification of steel by a comparatively little-known method, in which "spark pictures" formed by contact between steel and an emery-wheel can be used to indicate the properties of the steel. The only apparatus required is an emery-wheel, preferably attached to a small motor revolving at a high and uniform speed. Contact between the emery-wheel and different classes of iron and steel produces sparks having very distinct and easily recognised characteristics. By means of these characteristics the steel can be immediately classified, and for the purpose of checking and stacking steel in constructional engineering shops it is found that the time spent in classification will be from one-third to one-half that of classifying by any other method. Broadly speaking, the harder the steel the greater the array of brilliant sparks, and in the case of steel containing a percentage of metals such as manganese and wolfram, the spark will vary in shape, and, in some cases, in colour, so that such steels are also easily recognisable.

Amongst the metals tested, the following results were obtained:—

Wrought-iron: Many sparks, terminating in yellow balls.

Cast-iron: Dull sparks, each spark terminating in a group of smaller sparks having a feathery appearance.

Mild steel: Comparatively few spark-rays and a small number of tiny sparks at the end of the rays.

Cast steel: A brilliant array of spark pictures, each ray terminating in a small shower of smaller sparks.

Speedicut steel: Dull sparks, gradually fading to nothing.

Muschett steel: blood-red sparks.

Cobalterom: Dull sparks, terminating in yellow groups of smaller sparks.

Stellite: Short and blood-red sparks.

In a small handbook known as "Machinery's Reference Book, No. 36," reference is made to these spark pictures and to a paper read by Max Bermann before the Copenhagen Congress of International Association for testing materials. This reference gives further particulars of the theory of the spark formations and indicates the value of the test. It is stated that the spark is so sensitive that a difference of .01 per cent. of carbon may be perceived; such fine perception, however, requires extensive practice.

This test is also useful to ascertain the even quality of steel where any suspicion exists that portions of it differ substantially from the remainder, conditions which frequently existed during the war, when constructional steel was manufactured from shell discard steel. For hardening it is valuable as indicating the degree of hardness which has been achieved; for forging it is equally valuable for determining with certainty the malleability of the iron which is to be forged.

Grist, house, Ilsham-road; Mr. H. Cruse, two bungalows, Windsor-road; Mr. R. Tucker house, rear of "Empire," Ellacombe; Mr. W. Deakins, bungalow, Ilsham-road.

TRURO.—Bungalow, Chapel-hill, Mr. A. J. Cornelius, architect, for Mr. Dunstan.

UPPER RENFREWSHIRE.—Plans approved by the Buildings Committee of Upper Renfrewshire:—Double villa, Craignethan-road, Whitecraigs, for John Allan, builder, Dennistoun, Glasgow; villa, Alder-road, Hillpark, Eastwood, for John Galt, architect, Glasgow; cottage, Uplawmuir, for David Muir, Glenview, Uplawmuir; cottage, at Uplawmuir, for R. P. Stewart, Uplawmuir; bungalow, at Kilmarnock-road, Giffnock South, for George W. Dixon & Sons, builders, Giffnock; bungalow, at Woodvale-avenue, Giffnock South, for R. D. Melville, Church-road, Giffnock; four bungalows, at Busby-road, Giffnock, for J. & A. Dixon, builders, Kilmarnock-road, Giffnock; bungalow, at Patterton, for J. Grant Deas, Cathedral-street, Glasgow; bungalow, at Woodvale-avenue, Giffnock South, for J. Grant Deas; cottage, at Uplawmuir, for Alexander Cameron, Cathcart-road, Glasgow; double cottage, at Wedderlea-drive, Cardonald, for John Young, builder; double villa, at Busby-road, Clarkston, for James Wright, jun., 261, West George-street, Glasgow; bungalow, at New-road (Davieland Estate), Giffnock South, for J. B. Hunter, Glasgow.

WEST BROMWICH.—The T.C. has decided to purchase for £4,340 the vacant land on the Tantany housing estate, which includes a large pit mound. Part of the land, it is stated, would be suitable for building purposes, and 54 houses could be erected there.

WEYMOUTH.—Plans passed by T.C.: Jenkins, Hitt & Grant, bungalow, Fernhill-avenue; S. Jackson, conversion of "Ventura," Trinity-road, into flats.

WHITBY.—The U.D.C. has received the sanction of the Ministry of Health to the raising of a loan of £7,367 for the purpose of Spa improvements—an extended promenade, a new music pavilion, and a colonnade.——Plans passed: Shop alterations in Baxtergate, for the Star Tea Company; detached house in Upgang-lane, for Mrs. French; and a detached house in Upgang-lane, for Mr. A. E. Young.

WHITLEY BAY AND MONKSEATON.—The U.D.C. housing schemes now embrace the erection of 300 houses and not 200 as previously reported. Of this number, 200 will be working class dwellings, and the remainder represent an effort to assist private enterprise, for which £7,300 is to be borrowed in order to make grants of £75 per house as subsidy.

WIGAN.—The T.C. has decided to prepare a town-planning scheme for the whole area comprised within the borough.

FIRES

GOUROCK.—A disastrous fire, involving the destruction of Ashton United Free Church, the gutting of a two-story tenement, and partial damage to another tenement, has occurred in Albert-road.

SILSDEN.—The Airedale Mills, occupied by Messrs. John Knox & Sons, Messrs. Berry & Fletcher, Ltd., Mr. C. H. Fletcher, Mr. J. Walton, and Mr. E. Wiseman, have been damaged seriously by fire.

Carbonate of Lead.

The International Bureau of Works has just been notified that the Government of Checkoslovakia has ratified the proposal prohibiting the employment of carbonate of lead and sulphate of lead in any work connected with the painting of houses. This proposal was carried unanimously by representatives of the governments, proprietors and workmen at the Third International Conference of Labour, held at Geneva in 1921.

HEAVY TRAFFIC: SCHEDULING ROADS.

IN a recent article on heavy traffic on roads (September 28) we noted that a correspondent informed us that the law was deficient, as under the Roads Act, 1920, a road can only be thus placed out of bounds when actual damage has taken place. As we observed in our article we had not at the time of writing the Act before us, but on consulting the Act we now think our correspondent, unless there is some decided case on the point, placed an unnecessarily narrow construction upon the Act. The material section appears to be section 7 subsection (4), which provides "The Minister may by order on the application of any county council after holding a public inquiry prohibit or restrict, subject to such exceptions or conditions as to occasional user or otherwise as may be specified in the order, the driving of vehicles of any specified class on any specified highway within the area of the council in any case in which it appears to him as the result of the inquiry to be proved that a vehicle of that class cannot be used on that highway without endangering the safety of the vehicle or the persons therein or of other traffic using the highway, or that the highway is unsuitable for a vehicle of that class."

We fail to see how this subsection can be construed to involve actual damage being proved before the order can be made, for quite apart from the first provision as to safety there is the second provision that the road may be proved unsuitable for a vehicle of the particular class.

As regards the first provision as to safety it would be a novel reading of a statute directed to preventing the safety of the public being endangered if an actual accident had in each case to occur to satisfy the tribunal. It certainly would not be a case of "safety first," but "injury first and safety afterwards." Similarly we assume it would not be necessary for a road actually to founder or a building to tumble down before the Minister could be satisfied it was unsuitable for a particular class of traffic.

TRADE NEWS.

The Midland Joinery Works, Ltd., of Burton-on-Trent, has issued a schedule of their prices for joinery, timber, and mouldings, which should be in the hands of every builder.

Bristol Dock Scheme.

Bristol City Council has adopted a proposal of the Docks Committee to spend £1,000,000 upon the construction of the eastern arm of the Royal Edward Dock at Avonmouth. The extension will be 2,400 ft. long and 400 ft. wide, providing a length of quay of 4,870 ft., and a water area of 21 acres. Parliamentary powers for dock extensions were obtained in 1918, but these have been postponed owing to economic conditions; the great amount of unemployment has decided the Committee to proceed with the work as it would find employment for 1,000 men for four years, and would mean about £3,000 being paid each week in wages.

Negotiations are to be entered into with the Unemployment Grants Committee with a view of ascertaining whether, and in what manner, the Government will be prepared to render financial assistance.

The Institution of Municipal and County Engineers

A South-Eastern District meeting of this Institution will be held at Chatham on October 26. The programme includes reception at the Town Hall by the Mayor (Ald. H. F. Whyman, J.P.) at 10.30, a visit to the Dockyard, lunch at the Sun Hotel, and a visit to Messrs. Aveling & Porter's engineering works at Strood. Members desiring to be present should notify the hon. district secretary, Mr. S. S. Gettings, at the Council Offices, Dorking. Tickets for luncheon (exclusive of wine), 4s.

YORK.—For the demolition of old property and erection of new business premises, for Messrs. Marshall's, Ltd., successors to Marshall & Snelgrove, in Lendal :—
*Wm. Gott & Son, Leeds.

Sanitary Inspectors' Association.

The Northern Centre of the Sanitary Inspectors' Association held a meeting at Blyth recently. The assembly was welcomed by the Mayor of Blyth (Alderman John Goulding, builder and contractor), and amongst those present were Mr. W. Catcliff, of Newcastle, Vice-President ; Mr. R. J. Swaddle, Washington, Secretary ; Mr. Walter Smith, Northumberland County Council ; Mr. Thos. Cook, Ashington ; Mr. H. M. Coates, Mr. N. Park, Mr. J. W. Davison, Mr. J. Russell, and Mr. Chas. Irving, Tyne Port Sanitary Authority ; Mr. W. Irving, Blyth ; Mr. J. Fawcett, Blyth ; Mr. Robt. McKellar, Hebburn ; Mr. J. C. Corner, Newcastle ; Mr. J. R. McMillan, Backworth ; and others. The party paid a visit to the Blyth housing estate and the new arterial road to skirt the town, work on which has just commenced.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXV.—No. 4212. OCTOBER 26, 1923

BANK FAÇADES AND THEIR INFLUENCE.

only the liveliest intelligences in the commercial orld which realise the enormous importance to themves of the effect of the building in which they house eir hopes on the fleeting glance of the man in the street. this effect could be recorded its significance would be surprising. The design of the building is quite as t to the occupiers as their advertising. If it is a good will convey the purpose of the building unmistakably blic mind as definitely as a church or a dwelling-house. s effect will be negligible or adverse. But in visiting, in e of one's profession, dozens of banks, it is remarkable ly the design satisfactorily conveys to the mind the of the structure. There are banks which might be houses, there are banks which a man anxious to finish luncheon cigar with a suitable accompaniment might en for entering and ordering liqueurs; but even in tly improved period of architectural design it is still to come upon a design which completely "fills the r says to the man in the street, without the possibility , "I am a banking establishment."

s possibly because the rise of banking in this country has ce during one of the most hesitant and variable periods in the history of architecture; which has suffered from of phases and half-developed styles generally only understood except by the leaders of the passing It had the disadvantage of a time when the training unger members of our profession was about as bad d well be; but at the moment of writing we have ively recently entered a new road of professional we have no longer the excuses enumerated above. ng men now have the advantage of training in above that of our own youth, when the mundane e æsthetic to far too great a degree, and we have the f the increased importance and discrimination of ies admitting men to qualified membership of our art. efore, when we are better equipped, how can the f a building be expressed without resorting to, say, the f a certain French firm of tyre manufacturers in direct- sign of their elevations? How can we decorously passing glance?

ust first inquire as to what a member of the public In a bank, what is required of the banker himself r and quality? Briefly, before entrusting our fortune vings into the keeping of any man, we require f permanence and integrity. We shall require dignity ng of security in men to whom we trust our money. ng housing such men must, therefore, convey these It will require to inspire confidence, and to express rmanence, dignity, and honour, and it may have cording to its own individual importance. Let the ly these requirements as an acid test to the buildings and say how many fulfil the ideal. We cannot se qualities without scholarship, without taste and nd just proportion. How few of the buildings we day possess any of these attributes, and therefore fail d the attention which should be their due!

be said at once that those banking premises which actorily seem to fill the requirements are all in Re- r heavy Classic; but, although this be so, it may be that many other styles are possible. The qualities should be capable of demonstration in any style which is not barbarous provided the designer is great enough to accomplish it.

There will be many instances when Classic could not politely be used—in a strongly individual town like Chester, for instance. The problem has, however, been solved there with conspicuous success, and the result most certainly does convey the idea of a bank. So much for any bank as a unit. There is, however, something further now when banks are becoming huge organisations with innumerable branches. In order fully to satisfy the ideal it is necessary for the branches of one concern to have a "family" character so that they are readily recognisable as a "Jones" bank or a "Smith" bank. It is an advantage to a bank, and increases its importance in the eyes of its customers, if they, in passing through different towns, recognise readily the office of their bank. It flatters their choice of trust and adds to their confidence. Nor is it necessary to have them all like so many peas. Two sheets of manuscript by the same hand are at once recognisable, although their matter is different, and two paintings by a fine artist bear the imprint of personality although their subject may be different.

Nor is the desirability of catching the public eye in an unostentatious, but complete, manner of small importance. Experience teaches us that the public are greatly affected by externals. The psychological effect of an interior, for instance, on the mind of the person entering it is very far-reaching, and the exterior may attract his entry or discourage it. We know of one instance where a lady transferred a substantial account to a new bank "because it looked so safe," and although it may be said that the reason was a very feminine one, and that people should look rather to the balance-sheets and investment-tables of a bank than their premises, this is not done so consistently as might be imagined. Banks cannot advertise like drapers or big stores. In many cases their building is their one tangible advertisement, and one's idea of the stability and standing of the bank is influenced by it very greatly. There is also the man to be considered who at the moment has no banking account, but at any moment may have one—every one who looks at or enters a bank is in fact a potential depositor, and he will be very much affected in his choice of a bank by his impressions of the banks he has known. In short, a bank may make or mar its relative importance by the building it occupies, and as bank directors, like other members of the public, are not always well informed in architecture, it will rest very largely with the architect employed whether their building will add to or detract from their standing in their own world.

Although on this page technicalities are perhaps best avoided, it should be said that the choice of materials will affect very largely the impression given. We have seen designs completely ruined by the choice of an unsuitable material or colour. For work in a monumental spirit, and an important bank naturally has this spirit. Stone is the material which is most in favour, though terra cotta, we know, is frequently used.

In designing a bank, therefore, one cannot place too much importance to the design, however limited the means may be. It must be as solid and monumental as the means at disposal will admit. And this at least is true—that the finest banks have the finest buildings. One has only to consider the Bank of England to see how true this is.

NOTES.

Historic Value of Old Work.

When an old building appears to stand in the way of town improvement its artistic and historical value is necessarily a matter of concern which must be fairly established to justify retention. The most recent case of this kind is the Fort Clarence Arch at Rochester, which is a relic of military building of the Napoleonic era (1812). Much can be said in favour of retaining such objects of historic value, and it is for the citizens of Rochester to decide how far its significance justifies the small cost involved; but it is curious how hard a fight has to be made for the proper preservation of the artistic and historic values of our towns.

The Urgency of Housing.

Much appreciative sympathy will be extended to Councillor E. A. Savory, the chairman of the Bristol Housing Committee, in his energetic dealing with the housing question. In a speech delivered at Bristol last week he endeavoured to make clear the extreme urgency of the matter in Bristol, where, he maintains, 2,500 houses should be provided every year. Though at the beginning of the housing activities there were applicants for only 2,000 houses, there are now more than 7,000, and nowhere for the applicants to go. So urgent is the need and inadequate the means to provide for it, not only as to money but also as to the supply of adequate skilled labour, that Councillor Savory is bringing forward a scheme for bungalows at a cost of £195, to be built without the aid of either bricklayer or plasterer—bungalows which, he says, will last for 50 years, that can be built in three or four weeks, and can be let at 5s. a week. He does not decry any of the activities on foot, but maintains that some very cheap and simple form of building, such as he suggests, is absolutely necessary if there are to be enough houses for people to live in. We shall watch the experiment with interest and we hope that Mr. Savory will find adequate support for his timely efforts.

The Bank of England: The Old Dividend Office.

Tewkesbury Windows.

The preservation o fourteenth-century glass windows, whic hand of time have from the decay of the leadwork doubt to be desired, and we hope a result of the appeal for funds the required will be forthcoming. I always when we come to matters that the best way is ch making such repairs, and we ha injury done before now by such tions. With a mistaken idea of in the appearance, additions (such a edge of white glass surrounding th are sometimes added. Where the a for any such disfigurement is to we do not know, but instead of adhering to the masonry, it is such means to look as though from it altogether. We hear being added to the old glass at or cathedrals, which, if this is the very much to be regretted. Sor ago these windows in Tewkesbu encased in plate glass, but we h in the repairs now proposed to b taken this disfigurement to the ture will be removed, for when work is renewed it should b unnecessary. Stained glass, beautiful, is secondary to the fab and the effect of plate glass p fixed outside disfigures the mull is most unsightly. The risk of glass is not so great that it can preserved by such disfiguremen that no such protection was in until about forty years ago. present time, unfortunately, we n see this ugly addition protecting window which is not even a goo all, at the cost of the fine archi the church itself.

"An Almost Lost Art."

In an account windows given in we are told that unique both as ex an almost lost art," &c., thereb ing the superstition about se other mysteries which are su have been lost. There is no rea ever in this sentimental vie matter, and, far from any sec lost, we have probably much ex sources to aid us in our work to- are inclined to ask whether suc has any meaning at all; and it found decent burial with oth superstitions of like tendency, view is not only harmful to any judgment on the subject, but to contemporary work. Beca trialised stained glass is in inferior, that is not to suggest t glass carried on as an art is si similarly so. The best wi artists of to-day, though few, ca with the best windows of any talk of a "lost art" is only to

tive
the
al
my.

THIS exhibition of Early English painting, due so much to the initiative of Lord Lee of Fareham, pen at the Academy, should be exceptional interest, though not ng, as we should suppose, actual painting, which, being done on annot be removed to exhibitions. A selection of early work is shown which both for its treatment and subject matter will have plenty of instruction for us at a time when interest in the subject of mural painting is being revived. For there is much to be learned from this old work which, rightly interpreted, can be helpful to our present outlook, with its rather fumbling and theoretic approach of the subject of mural painting. It appears to us that the promoters fall into a rather persistent error in labelling the exhibition as the work of "primitives"—a comparatively recent term growing out of a rather superficial reasoning on the matter. An appellation which sees only one side to competence, and by inference conveys the idea that what can be acquired by any really intelligent art student is not primitive, while the work of these old masters is covered by such a word, conveys a very false impression. A more enlightened understanding of the matter reveals to us that in dignity of imagination, in the power to reach the level of the subject matter treated, these so-called "primitives" had a grasp which it would be well if we could emulate; and it seems to us a pity on such an occasion to give further currency to a very superficial interpretation of work which is noticeable for the extraordinary identity of means to ends, which setting out to interpret a great subject matter succeeded in stamping it with such vividness of representation.

Working by Rule.

AN illuminative comment on the work of an old-time architect occurs in the paper on Ligorio, by Mr. C. A. Harding, A.R.I.B.A., in the current issue of the R.I.B.A. *Journal*. He says: "In the buildings of Ligorio there is no suggestion that he ever attempted to seek for rules, though he was probably better versed in the details of Roman architecture than any other man of his day." It is one of the common fallacies of human reasoning that there can be found rules and regulations for producing anything, but the man who is born with the artistic instinct seldom takes much interest in the diagrams and arguments which are put forth to prove that many great works of art were manufactured out of rules.

Caterham School Memorial Hall Competition.
Design placed First: By MESSRS. KIEFFER, FLEMING & KEESEY. (*See p.* 640.)

GENERAL NEWS.

Professional Announcement.

Mr. B. J. A. Smith has commenced practice as an architect and surveyor at Newbegin, Hornsea, and would be pleased to receive trade catalogues.

British School at Rome.

On the recommendation of the Faculties of Painting and Sculpture of the British School at Rome, the Commissioners have awarded the Rome Scholarship in Decorative Painting to Mr. Alfred Kingsley Lawrence, a student of the Royal College of Art; and the Rome Scholarship in Sculpture to Mr. David Evans, a student of the Royal Academy Schools.

The Royal Institute of British Architects.

We have received the syllabus of the Royal Institute of British Architects for the Session 1923–24. The principal meetings are as follows:—November 5: Inaugural Meeting, President's Address, at 1, Wimpole-street, W.1. November 19: General Meeting, Mr. G. Topham Forrest on "The Rebuilding of Ypres" (Wimpole-street). December 3: Business Meeting, Election of Members, at 9, Conduit-street. December 17: General Meeting, Mr. Raymond Unwin on "Higher Buildings in Relation to Town Planning" (Wimpole-street). January 7: Business Meeting, Election of Members. January 21: General Meeting, Professor Percy Nobbs on "Architecture in Canada." February 4: General Meeting, President's Address to Students and Presentation of Prizes. February 18: General Meeting, Mr. Paul Waterhouse on "The Charing Cross Bridge." March 3: Special and Business Meetings; Election of Royal Gold Medallist; Election of Members. March 17: General Meeting, Mr. Hope Bagenal on "Planning for Musical Requirements." March 31: General Meeting, Mr. H. S. Goodhart-Rendel on "The Gothic Revival." April 14: General Meeting, Mr. D. F. Slothouwer on "Modern Dutch Architecture." May 5: Annual General Meeting. May 19: General Meeting, Mr. Sydney Perks on "London Town-Planning Schemes—1666 and After." June 2: Business Meeting, Election of Council and Standing Committee, Election of Members. June 23: Presentation of the Royal Gold Medal.

R.I.B.A. Medal for Schools of Architecture.

The R.I.B.A. Board of Architectural Education Medal for the best set of drawings submitted by post-graduate students exempted from the R.I.B.A. final examination, has been awarded to Miss I. M. Chambers, of the Architectural Association. Miss Chambers will receive the medal at the annual presentation of prizes at the R.I.B.A. The drawings prepared by Mr. C. H. Hutton, of Liverpool University, received high commendation.

R.I.B.A. Archibald Dawnay Scholarships, 1923.

In accordance with the terms of the will of the late Sir Archibald Dawnay, the Royal Institute of British Architects have awarded one Scholarship of £50 per annum to Mr. R. W. Donaldson, Liverpool University, and two Scholarships of £25 per annum each to Mr. R. H. Turner, Liverpool University, and Mr. A. E. Cameron, Architectural Association. Mr. C. H. Hutton, Liverpool University, who was awarded a Scholarship of £25 for 1922–1923, has been granted a renewal of his Scholarship for 1923–1924.

The scholarships are intended to foster the advanced study of construction and the improvement generally of constructional methods and materials and their influence on design.

Peers' War Memorial.

In accordance with the arrangement arrived at in the House of Lords in August last, the question of the site for the proposed Peers' War Memorial in the precincts of the Chamber was referred to a referendum of the Peers, which was to be determined by the middle of October. The result is now announced as follows:—For the site in the Princes' Chamber, 204; for the site in the Royal Gallery, 134.

EAST LANCASHIRE MASONIC HALL COMPETITION.

In a limited competition, where each competitor receives a solatory fee for his design, it is, of course, open to the promoters to make any rule they think fit when the award has been made; but it appears to us it is to be regretted from the point of view of the profession at large and possibly from that of unsuccessful competitors, that, in this instance, no designs were open to review but the winning one. This rule, as far as we can ascertain, was not the expressed desire of the competitors. The conditions, in fact, provided for the exhibition of the drawings, and it may therefore be possible in a future issue to give one at least of the designs submitted, when, on the return of the drawings, the reticence of the promoters will not interfere with their publication.

In these circumstances it is very gratifying to be able to say that the successful design is of such exceeding beauty of conception and adequacy of purpose that any of the other schemes submitted would have to be exceedingly good to better it. The authors of the winning design, Messrs. Thomas Worthington & Sons, are to be congratulated. The interior alone ensures that it will be an addition to the architecture of the district in the highest sense.

Particularly effective is the manner of entry provided. One will pass through a lobby of refined aspect into a crush hall, the dignity and solemnity of which is entirely appropriate and which is the dominant feature of the design. It is flanked by Ionic columns and has a coffered barrel ceiling. The perspective of the room leads the eye at once to the entrance of the main ante-room, which is raised above the general floor level and gives the religious sense which is the true aspect of freemasonry.

The principal ante-room, which is placed between the more important lodge room and the banqueting hall, strikes us as small when its importance is considered, but no doubt, as in most competitions, some amendments will be effected when the working drawings are made.

Competitors had to provide for the Masonic club, which had to be separate from the lodge itself, and this has been accomplished very cleverly in the design. The entrance is effected by a main staircase suitably retired from the crush hall and the club rooms grouped round the upper part of this hall. By this they are entirely isolated from the Masonic Rooms themselves. It seems rather unfortunate that the entrance door to the club is fixed cheek by jowl with the head of the stairs, but this again, no doubt, can be improved if desired at a future time. It is interesting to note the manner in which the condition calling for access from the club to the banqueting room is obtained—a private staircase is arranged between the crush hall wall and the service portion which leads straight from the club premises to the main banqueting hall below.

On the floor above a lodge and banqueting hall is provided (and here again we venture to suggest that the same remark applies to the ante-room), and on the front of the building sufficiently above the street for reasonable quiet to be obtained is the common room and museum. On the floor above a lodge is provided, and the rooms of the caretaker, where, by the way, the entrance to the bathroom is effected through the living room and scullery.

Speaking generally of the arrangement, Professor Reilly, the assessor, says:—"The successful architects have placed all the chief portions of the building each in the position best suited to it. They have proved, moreover, by the large scale drawings of the crush hall, chief lodge room and banqueting hall, that they can give to such apartments dignified and satisfactory expression. Internally, therefore, they may be said to have found a fine architectural solution to the complex problem presented to them, the practical character of which a closer study of their drawings will only amplify. The kitchen arrangements, for instance, are all very well thought out with admirable me receiving and checking goods and with of storage space."

Professor Reilly speaks highly of the el and we can fitly endorse his praise. W sider that the entrance itself might ha further emphasised, and that the junc the pavilions and the main entablature difficult to treat in practice if a good is to be obtained. An important lodge is also provided on the mezzanine floo all five separate lodges will be provid (Prof. Reilly) says of the elevation:—

"Externally it seems to me the winne been equally successful. By designing a but well-proportioned building and by back the central section they have given building a sedate and serious aspect making it gloomy. The fine plain wall s they have obtained give the building dignity. In appearance it is neither a c cial building on the one hand nor a mu one on the other. It suggests what i building for a dignified purpose, yet an and welcoming one. The rich frieze and which crown the central block, seem to only beautiful features in themselves indicate refinement and nobility in the of the building. This frieze and corn echoed by the long continuous stone l below the first floor windows, which ser architectural reason of binding the building together near its base, at the san providing a pleasant communal feature club windows."

The masons of East Lancashire wil every reason to be proud of their new ho it certainly conveys the spirit of good m

COMPETITION NE

Caterham School Memorial Hall, Hu

In this limited competition Mr. Hamp, F.R.I.B.A., the assessor, has m following award:—

First premium (50 guineas), Messrs. Fleming & Keesey, 83, Pall Mall, S.W.

Second premium, Mr. Hugh T. A.R.I.B.A., 11, Gray's Inn-square, W.C

A review of the designs appears on pa and the design placed first is illustra week.

"The Builder" Cost of Building Com

In our next issue we hope to give th of the assessor in Part II of *The Builder* Building Competition.

Shops, Ashton-under-Lyne.

For the T.C.—Designs for lock-up s the Market Hall. Premiums, £50, £30

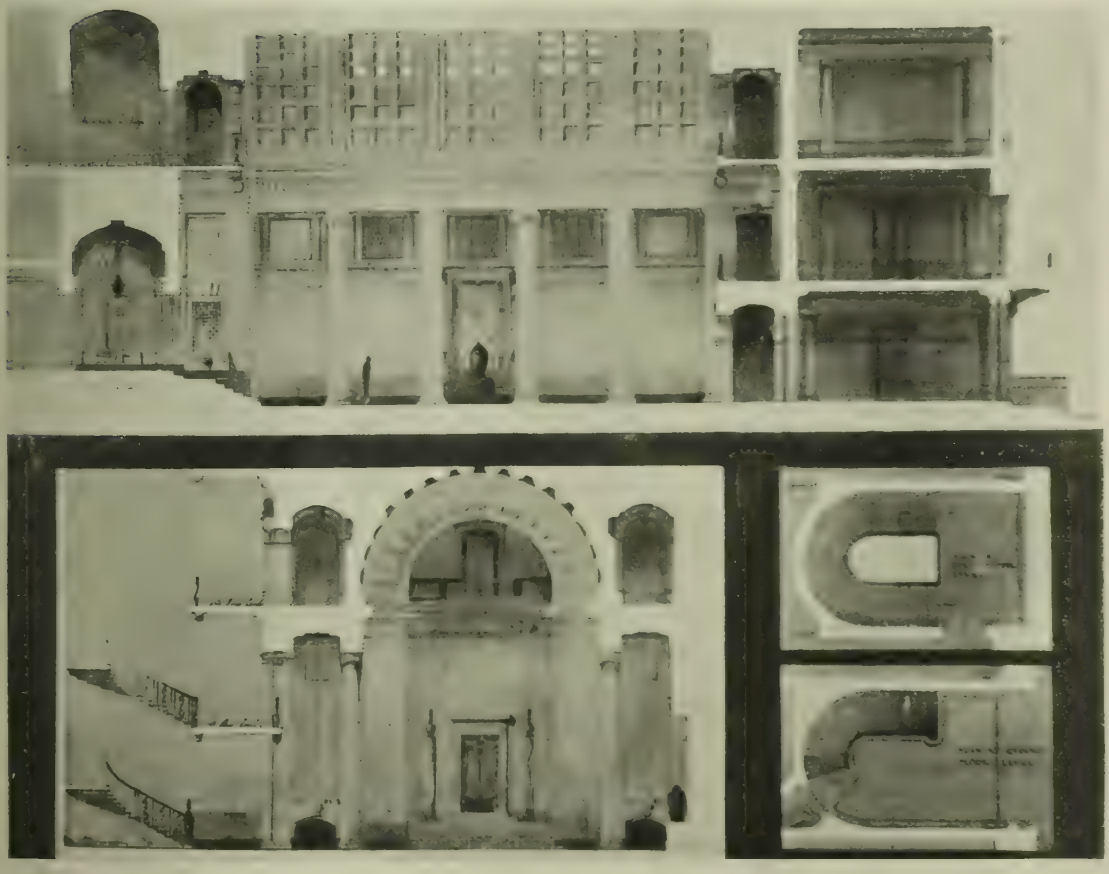
For the Corporation.—Designs for hall and swimming baths. Three prem £750, £250, and £100. Sending-in da ruary 1, 1924. (See advertisement this



British Empire Exhibition.

Designs for (*a*) dining-room and hall; room in the Palace of Arts at the British Exhibition, 1924. (*a*) Premiums: 125 25 guineas; for the best model 20 gui Premiums: 100, 40 and 20 guineas; for model 20 guineas. The jury will cons Edwin Lutyens, R.A., Miss Ellen G. Sir Lawrence Weaver, Mr. P. Morley and Mr. Norman Wilkinson. Designs addressed to 20, Tavistock-street, W later than December 17.

Other Competitions.

Other competitions still open incl following (the dates given are, first the in date, and second the issue of *The B* which full particulars were given):—S College (Jan. 1, 1924; March 30). Gallery (Nov. 5; May 4). Dudley (Jan. 5, 1924; Sept. 14). Eastle Bishopstoke Assembly Hall — *Bat R.I.B.A.* (Dec. 3; August 24). Taun Memorial (Nov. 30; Oct. 5). Memori Missing (Jan. 1, 1924; Aug. 3). Memorial (Oct. 29; Oct. 12).

East Lancashire Masonic Hall Competition, Manchester.

First Premiated Design: By Messrs. Thomas Worthington & Sons. (*See p.* 636.)

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Competition System.

SIR,—It is some three months since Mr. Robertson's article, "The Competition System," appeared in your Journal, and a sufficient period has now passed for his suggestions to take root in the minds of those to whom the regulation of competitions has been entrusted. The whole-hearted support readily given by a host of distinguished correspondents fosters the hope that ere long the fruit will issue in the form of a new scheme embodying his suggestions.

The jury system has everything to commend it. The only objection which at first sight appears to carry any weight is the question of cost; but surely this is only a matter of adjustment. High fees trebly levied is a bogey. Assessing ought not to be a "trade" asset of the architect. No architect desires to be professionally designated "Architect and Assessor," although it would appear that under existing conditions we are drifting that way. "Pupil farming" is a dying industry, and with its demise let us hope for that of super-fee-ed assessor.

Examiners of architectural schools and the R.I.B.A. perform their onerous duties as assessors without thought of profit and often with considerable loss. Although it would be unwise to render the same sacrifice in the case of competitions in practice, yet I do not believe there would be a lack of competent assessors as jurors when the question of fees had ceased to be alluring. The little extra required to cover the cost of a moderately fee-ed jury over that of a highly-fee-ed assessor does not present a real difficulty.

The pros and cons of the question have been so fully threshed out in your columns that there is little further to add. It is significant that the initiative has been taken by the head of an Architectural School, and has been supported by most of those who are so engaged. As Prof. Reilly has pointed out, assessing by jury is part of the everyday work of a school where its value is known by long experience. The breakdown of single judgment is more frequent than one knows. The method of working the jury system is a matter on which there can be differences of opinion; there ought to be none on the principle of it.

Manchester. ARCH. C. DICKIE.

Trafalgar Square.

SIR,—On April 20 last you were good enough to publish my design for the improvement of Trafalgar-square. I have recently been in communication with the Office of Works, and I have ascertained that the Government has a memorial scheme in hand for dealing with the square, and that it will probably employ an artist of its own selection at the expense of the public. The Government, with its usual secrecy, declines to say what the scheme is, and who is the favoured artist to be employed.

Trafalgar-square is a national asset, and whatever is done in the way of a memorial should, I think, be the subject of an open competition amongst sculptors and architects—not any particular one to be nominated direct by the Office of Works; but only public protest can prevent what looks like another example of unwarranted favouritism.

In a letter I addressed to the Secretary of H.M. Office of Works on August 31 last, I said that if the cost of the proposed memorial were to come out of the public funds there should be an open competition for the work.

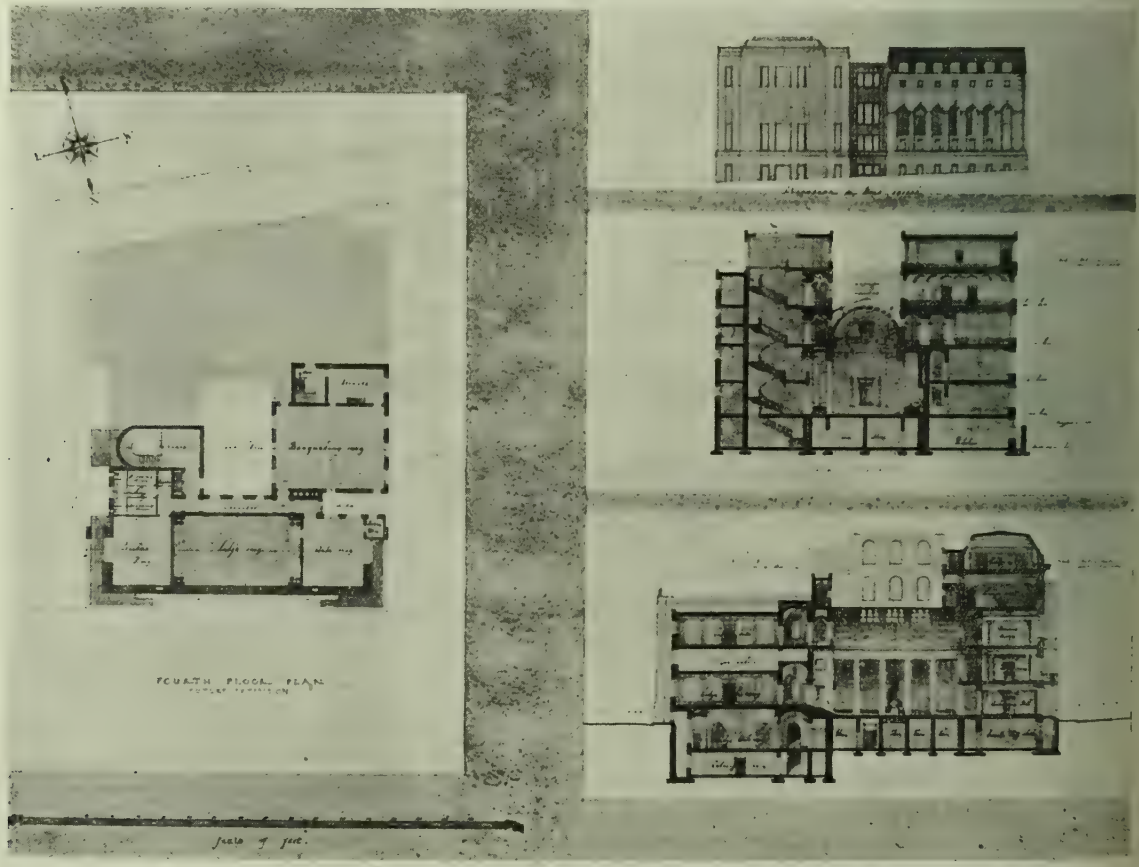
WM. WOODWARD.

Parallel or Tapered Baths.

SIR,—I agree with the writer of the letter in your issue of the 12th inst. that tapered baths are on the whole preferable to those whose sides are parallel, as the latter certainly use more water. But parallel baths possess the advantage that they can be fixed with the side next the wall parallel thereto, whereas tapered baths cannot; in that tion they look unsightly and one half of apparent gain in floor space is wasted.

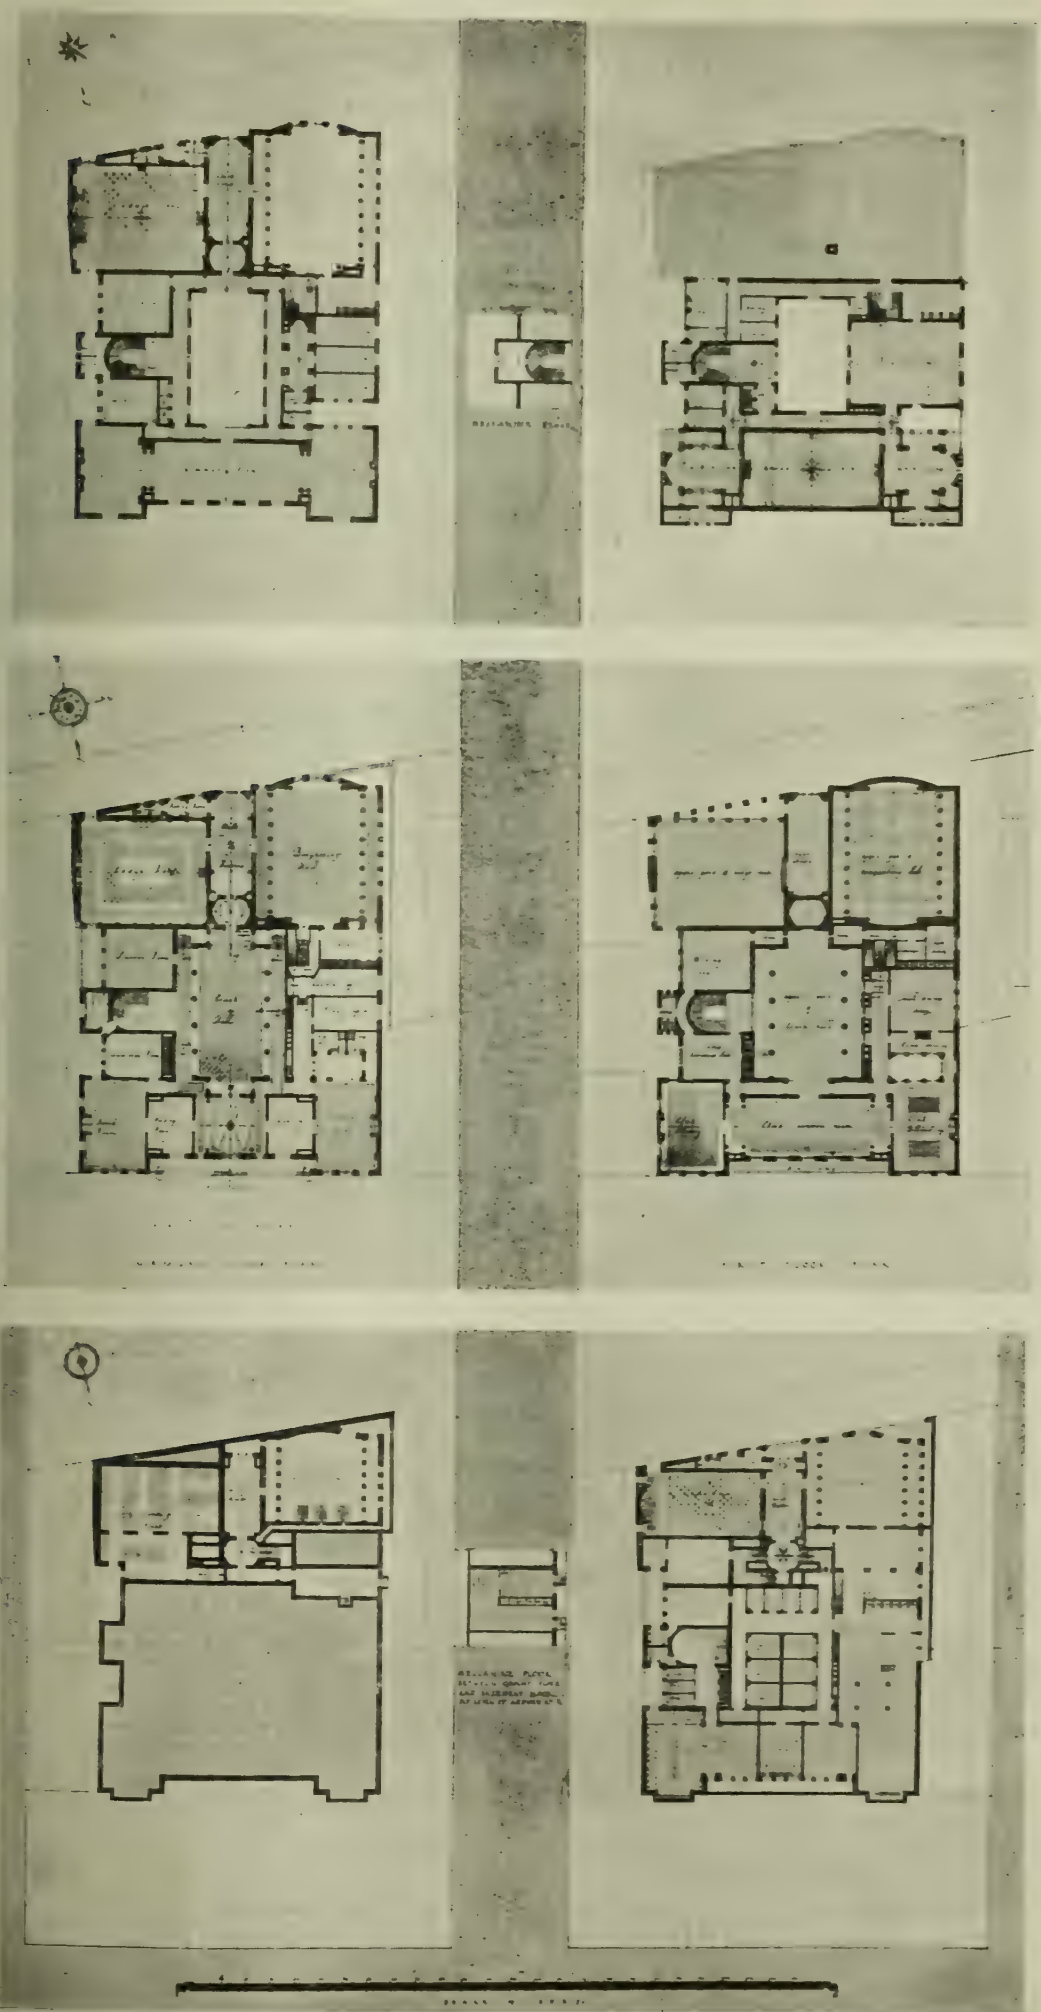
All these difficulties could be met by ta baths made with the foot square to o the sides instead of square to the axis present, so that they could be fixed wit side parallel to the side wall without thr the foot out of parallel with the end This would necessitate right and left patterns, but there would be no more diff in ordering a right- or left-hand bath th ordering a right- or left-hand kitchen ra

Lincoln. W. G. WATK



Town Planning.

SIR,—My attention has been drawn letter in your last issue and a paragraph of relating to the North of England Divisi the Town-Planning Institute. It was anticipated that this would attract attenti soon, but it is the intention of our divisi attempt to collect information for the g benefit, and, in point of fact, it will be i form of a questionnaire and will be sent to a local authorities in the division. Its succe failure will largely depend on the careful re of the questions and on the local officials sh sufficient interest to comply with the sugges



Your correspondent suggests that this s be done periodically, but there are som hundred local authorities in our area, and so would be a great task. Certainly, how those responding will receive the addi questions asked by officials themselves, an authority inquiring will have any inform it asks if we have been able to collect it.

It is easy to speak harshly of institute their lethargy, but bodies like the Town-Pla Institute have a very proper sense of di and the greatest care has to be exercised b any unusual step is taken, as their activit easily be misunderstood.

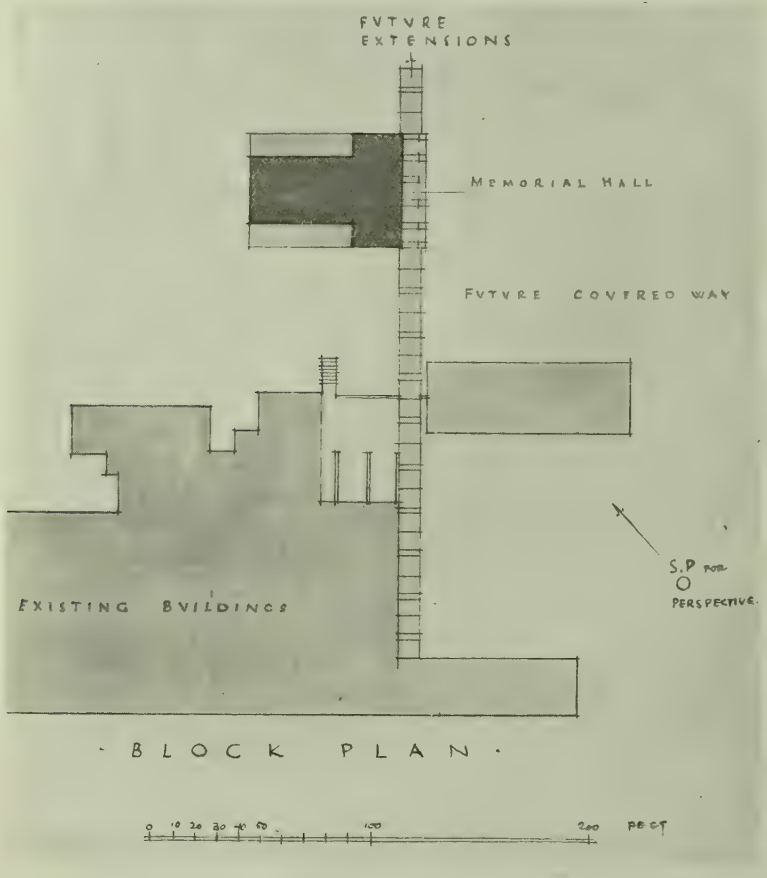
MEMORIAL HALL, WITH LIBRARY, CONGREGATIONAL SCHOOL, CATERHAM.

A LIMITED competition by nine selected architects for a new Hall, with adjacent Library Rooms, proposed to be built on a hillside site at the rear of the Caterham Congregational school, has just been determined. Mr. Stanley Hamp, F.R.I.B.A., acted as the assessor appointed by the School Committee. The plans have been on view in Farringdon-street, at the Congregational Memorial Buildings. Nothing could be more explicit than the conditions issued to the competitors, save in one incidental particular. The promoters intend ultimately to connect the existing school premises with this new Hall, and casually included this brief reference which has been differently interpreted by the competing architects. The words employed are these: "The buildings should be so placed that it can be possible to connect the main building by a new corridor to covered way from the present entrance door at the foot of main stairs (south end)."

Most of the competitors have endeavoured to furnish a completed independent building without incorporating the suggested covered way (chiefly consisting of a series of steps) as an integral part of their design. The minority took a more generous view, and realised the chance of producing a more ambitious edifice by embodying these adjuncts. This was done no doubt in good faith and with success, as the award is in their favour. The majority evidently concluded that the allusion to the corridor primarily was intended to fix the precise position of the south front of the new Hall. It is difficult to compare plans varied as these are by an initial discrepancy of this kind. We do not otherwise take an exception to the choice which the referee has made, and on the whole, perhaps, he could come to no other conclusion, although an element of doubt is reasonably allowable. It may be well to say that we have visited the site.

Only two out of the nine schemes show the arrangement of the bookcases and seats on the plans of the Library rooms, viz., Nos. 7 and 8. Both of these proposals are Renaissance in character. Nos. 8 and 9 are the only ones which rely on the attached corridor for essential features, as shown by their perspective views, and both were chosen either for the first or second place. No. 6 is the sole example providing a plain unbroken wall up against which the future covered way might be fixed without interfering with the lighting of rooms or design of the elevation.

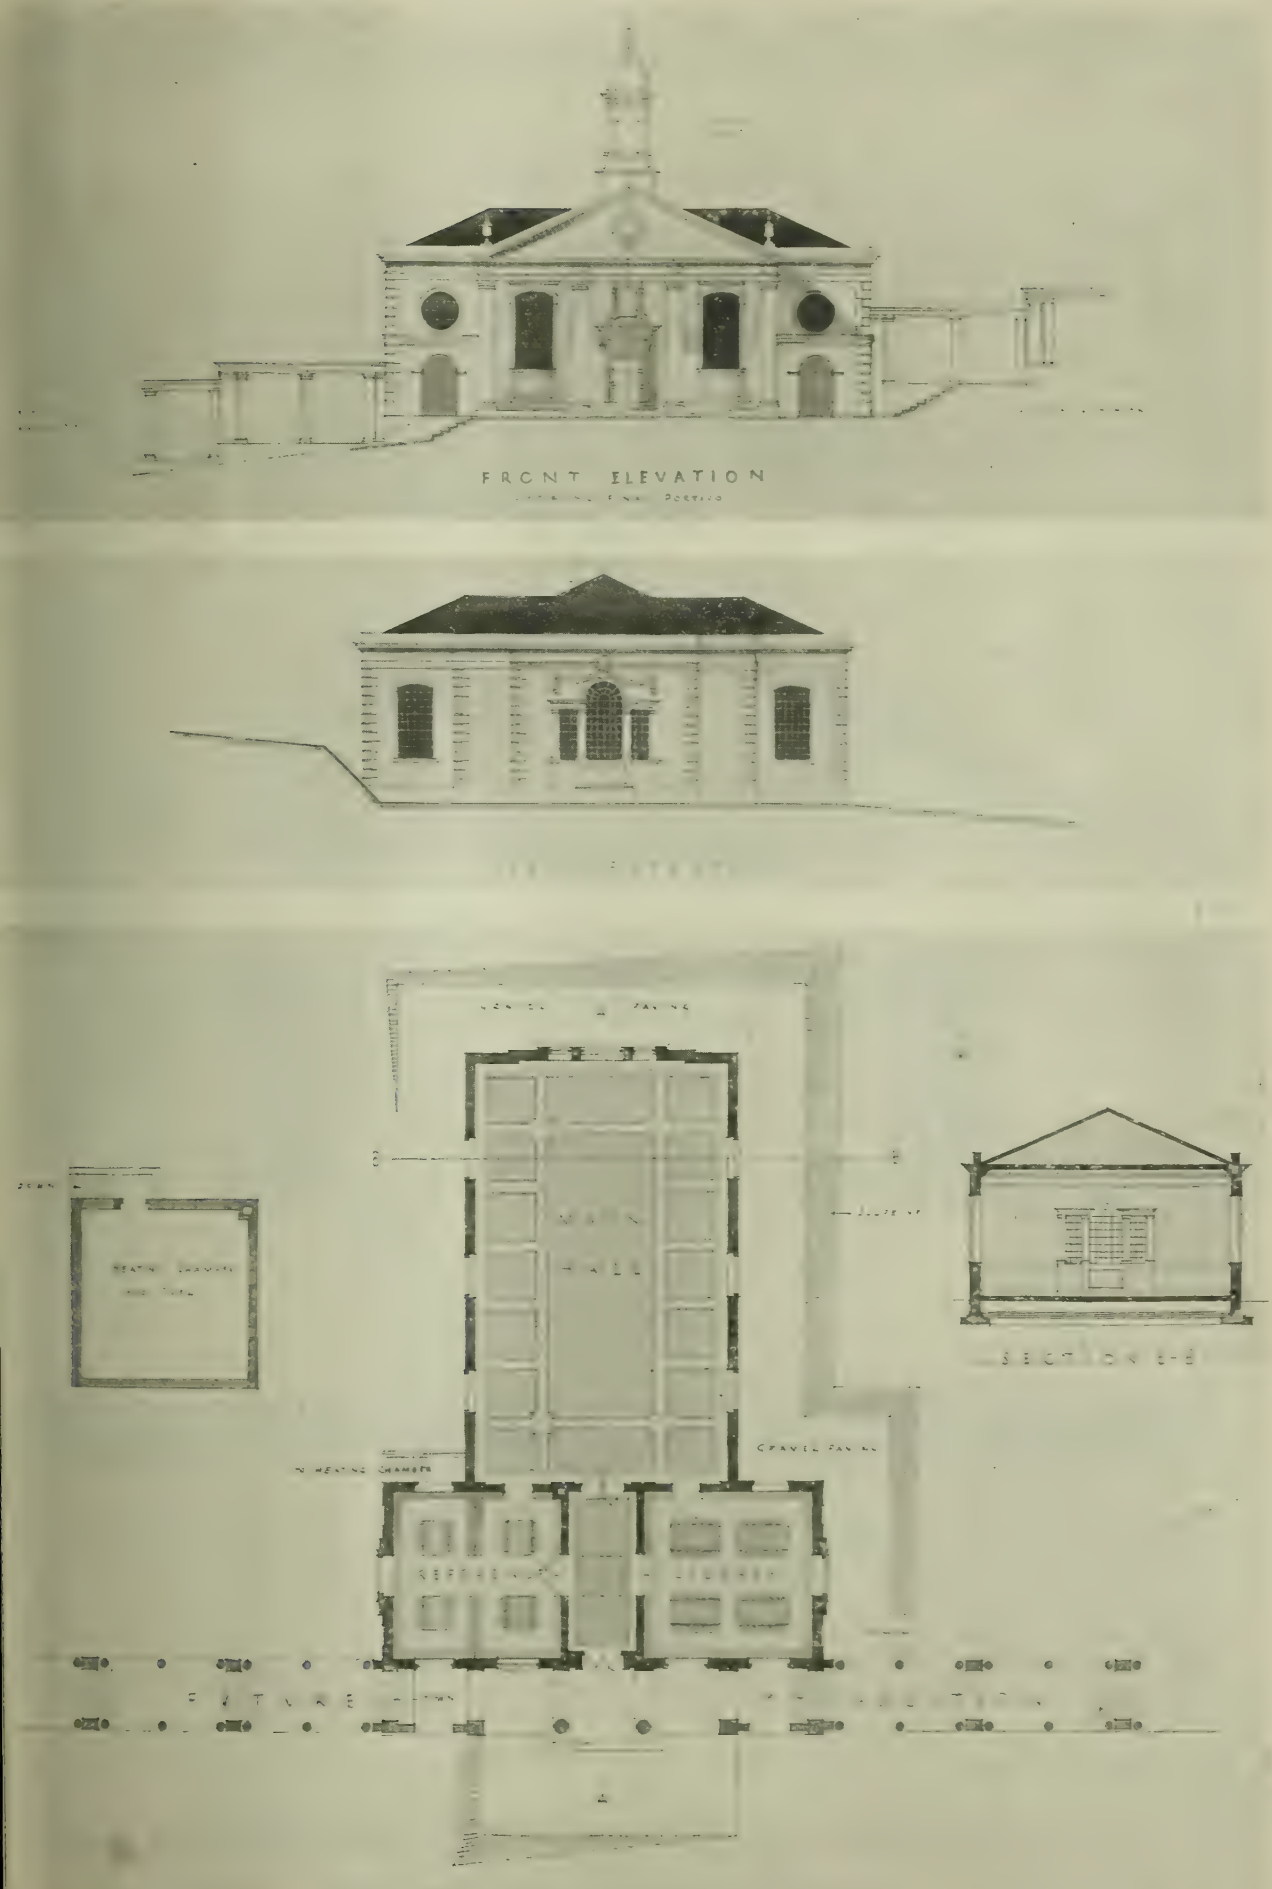
The chosen design, No. 8, is the work of Messrs. Kieffer, Fleming & Keesey, 83, Pall Mall, S.W. A gravelled terrace forms a tableland on which to set the building with some consistent regard to its classical horizontal lines suggested by eighteenth-century precedents. The effect as seen in the perspective is picturesque and imposing, the principal features being the pedimented portico and open stone-built turret rising over the central entrance vestibule between the two transeptal library rooms. It has a domical roof terminating with a pineapple, after the approved method of the Wren period. This portico, with Doric columns and the turret behind the pediment, are not included in the estimate. Of course they could not be, as the provisional amount is restricted to £4,000. The required half-inch scale detail, however, is devoted to this handsome adjunct, which is introduced as part of the covered way through which the Hall is reached. The up the hill extends beyond it. To justify a monumental feature a vista in front requisite, but the trees growing on the slope render such a view impossible, road facing this south façade is out question. Big trees of much beauty gro very near the north end of the Hall s the carved swags over its three-light w scarcely ever would be seen. As a mat fact, this new block generally must be v either from 30 ft. to 40 ft. below, whe playground and swimming-bath road co by looking down between the trees from on the hill. A series of steps must b vided to lead up to the building, bu covered way as contemplated can o decided on later when funds permit.



The plan of the selected design is lik or two others, but its Hall is unique a low-pitched roof and flat ceiling plaint fered. We reckon this section to be the expensive and the most suitable proposal library rooms, right and left of the ce hall, have fine architraved doorways lik into the Hall. The exterior is faced wi brick and covered with Roman tiles. angles have stone quoins, and the entire front is practically in masonry, it also in the portico.

No. 9 is placed second. It has a very general layout, but the library rooms i transepts give a more decided ⊥ shap room being 24 ft. long by 17 ft. 3 in. whereas in the chosen plan they are 20 ft. square. The section of the Hall is different, with a steep roof built up laminated trusses, the lower timbers c down to about 6 ft. above the floor. Th walls measure 12 ft. 6 in. high, and is no cornice. Six sloping buttresses tak thrust. There are three hipped dormers on each side of the roof for v tion and light. The north-end big c window in gable gives ample room beh display of slides or diagrams or scenery dramatic performances could well be he there are no retiring rooms and the H too small. This design externally capital Renaissance doorway with a head set under the eaves of the long unl roof slope. This is quite simple and nic when the covered way is built, as th spective makes clear, hipped roofs will forward with a flat between them, and covered way with a verandah front wil an essential part of the library and its windows.

No. 6 accommodates itself to the site, the Hall being handled in a dist manner with a lofty roof covering a segm plastered ceiling, with iron trusses con tion. The library rooms are kept low the vestibule leading to the Hall is set west corner. Its door balances insi Hall with another like it going into the ence library, which is reached throug reading room from the vestibule. The c way up from the playground can have i fixed against the plain wall on the sou already mentioned. There is a paraj round hiding the lantern lights ov library rooms.



No. 7 has a projecting porch on the w end of a terrace, approached from the s way up the hill, and at the south end mental extension gives a platform in fr the Hall entrance. This has a bold pro tester hung on raking chains over the so no covered way could come there time without spoiling this fine portal. library rooms are at the north end of the from whence they look like a pair of r rooms.

No. 3 is one of the most suitable in respects. It has a big central porch side of the Hall, and set between the r rooms, measuring 26 ft. by 15 ft., pla wings to the south side of the Hall. kind of forecourt is, therefore, manag front, rather pretty and countryfied. N form was asked for and the seats clut the hall. The exit would be difficult.

LLUSTRATIONS.

s for the Manchester & District Bank, Liverpool.

TER.—Th's building conforms to the half-d condition existing in Chester, both in l new buildings. The site was, unfor-, rather small for the requirements of the hich would have been much improved by public space. The following is a list of ors who carried out the work: General tors, John Mayers, Sons & Co., Ltd., ; steelwork and strong-room, W. ald & Co., Ltd., Manchester; oak g, W. & T. Wood, Hartford, Cheshire; tings, Armitage & Wolff, Manchester; lighting and bells, F. J. Jones & Co., ; warming, Saunders & Taylor, Ltd., ster; strong room door and fittings, & Sons, Ltd., Manchester; electric lift, Bell & Co., Manchester; grates, &c., e Co., Ltd., Manchester; floor and wall Conway & Co., Manchester; leaded Villiams, Gamon & Co., Chester; locks r furnishings, N. F. Ramsey & Co., nam; wood carving, Earp, Hobbs & Manchester. The clerk of works was E. Fenna, of Willaston, Nantwich.

PORT.—These premises consist of an old nan house under Bank Hall, and it was to build out a banking room on the t the back and use the front portion of ling as manager's room, clerks' room, hall, and so on. The work was just ed when war broke out, and was ntly very much delayed in completion, he work having to be suspended until

llowing is a list of the contractors who out the work: General contractor, ry Bardsley, Stockport; oak panell-Bland & Son, Ltd., Salford; bank H. Shepherdson, Stockport; electric McLure & Whitfield, Stockport; , &c., Combined Concrete Co., Man-wood carving, Earp, Hobbs & Miller, er; electric lift, Waygood-Otis, Ltd., er; strong room door, Chubb & Sons, nchester; electric light fittings, Geo. Ltd., Manchester; wall tiling, Conway Manchester. Mr. H. Smith, of Man-was the clerk of works.

ORT.—The site is a long, narrow one treet, and the whole of the front is with a large portico built in Portland he following is a list of the contractors ed out the work: Brickwork, B. R. Sons, Southport; stonework, T. A. Southport; plumbing and decorating, ros., Southport; plastering, Thos. h, Southport; internal joinery, Dux-s., Southport; steelwork, fireproof c., W. Macdonald & Co., Ltd., Man-warming installation, G. N. Haden & nchester; steel windows, Humphries, & Ambler, Manchester; bronze windows and ceiling lights, Luxfer Co., London; electric lighting, Lightfoot Bros., Manchester; litholite stone, Pearson Bros. & Campbell, Liverpool; strong-room doors, Chatwood Safe Co., Bolton; safes and fittings to strong-rooms, Chubb & Sons, Manchester; electric passenger lift, Wadsworth & Sons, Bolton; marble work, J. & H. Patteson, Manchester; wall tiling, Conway & Co., Manchester; bank fittings, H. Shepherdson, Stockport; grates, &c., Well Fire Co., Ltd., Manchester; rubber flooring, Hooley-hill Rubber Co., Manchester; sanitary fittings, Musgraves, Ltd., Liverpool; staircase, balustrade and lift enclosure, George Wragge, Ltd., Manchester. The following work was carried out by the Bromsgrove Guild, Ltd., Bromsgrove, Worcestershire: The main entrance doors, bronze sliding doors, portable bronze gates, name tablets, electric light fittings (wall brackets), special furniture for manager's office, and all the door furniture throughout the building. Mr. J. E. Thorpe, of Waterloo, Liverpool, was the clerk of works.

The architects are Messrs. Francis Jones, F.R.I.B.A., and H. A. Dalrymple, A.R.I.B.A., of Manchester.

Bank at Southampton.

The new premises of the London Joint City and Midland Bank, Ltd., at Southampton, have recently been completed by Messrs. W. H. Gaze & Sons. The architects are Messrs. T. B. Whinney, Son & Austen Hall, of 8, Old Jewry, E.C. 2.

Barclays Bank, New Oxford Street.

This building, at the corner of Hart-street and New Oxford-street (No. 28, New Oxford-street), is the New Oxford-street Branch of Barclays Bank, Ltd. The architect is Mr. Dudley G. Marsh, of 38, Chancery-lane, W.C. 2. The work was executed by Messrs. Gilbert Seale & Son, of 22, Lomond-grove, Camberwell, S.E. "Atlas White" Portland cement was used on the exterior.

Bank of Liverpool and Martin's, Ltd.

This new bank, which is now in course of erection, is situated in one of the principal thoroughfares in Blackpool, on a site which was lately occupied by two shops which have been entirely cleared away. The ground floor is occupied by the bank proper, the upper floors being suites of offices. The front is in Darley Dale stone, and consists of a heavily rusticated base, rough axed on alternate courses. Over the base are four Corinthian columns supporting the entablature and pediment in which the bank coat-of-arms is carved, the whole being reminiscent of Italian work. The doors and windows are cased in bronze. The interior is treated in the Doric style, the order being in marble, while the walls above dado height are panelled in fibrous plaster. The fittings, panelling, doors, &c., are in French-polished mahogany, while the floors are fireproof and wood block covered (except to entrance vestibule and public space, which are mosaic). The architect is Mr. Walter Wade, Lic.R.I.B.A., of St. Anne's-on-Sea, and the contractors are Messrs. J. Parkinson & Sons, Ltd., Blackpool.

Premises for Westminster Bank, Ltd.

The illustration published this week represents the first sketch for a new branch of the Westminster Bank, Ltd., about to be erected in Vauxhall Bridge-road, S.W. The front is to be of Portland stone; a columnar treatment has been followed by desire. The builders are Messrs. F. G. Minter, of Putney. Messrs. Niven & Wigglesworth, FF.R.I.B.A., of 7, John-street, Bedford-row, W.C.1, are the architects.

Premises for the National Provincial & Union Bank of England.

Coutts & Co., Park-lane Branch.—In this work internal fittings and decorations were put into an existing building; specially selected "fiddle" grain mahogany quartered panels are used. The general contractors are Messrs. J. Simpson & Son, of Paddington-street, W.1; woodwork and fibrous plaster by G. & A. Brown, Ltd., Hammersmith-road, W.6; bronze grilles and plates by the Birmingham Guild, Ltd., of Berners-street, W.1; marble by Messrs. Fenning; heating by J. Slater & Co., W.1.

Ramsey.—This building is in course of construction. The materials used are old bricks from the building pulled down and Clipsham stone dressings. The old bricks are the local Eastern Counties white brick, which have now weathered to the pleasant olive grey with warmer tones of pinkish mauves characteristic of the Eastern Counties. The warmer-toned bricks have been picked out for the trim to windows. The general contractor is Mr. J. Cracknell, of Peterborough; lead lights and casements, Geo. Wragge, Ltd.; stone carving, G. & A. Brown, Ltd.

Platts-lane Corner.—This illustration shows the building before treatment and after. The front is carried out in "Atlas" cement, the construction of the building leaving no chance of using stone. The general contractors are F. Troy & Co., Ltd., N.W.3; woodwork and fibrous plaster, G. & A. Brown, Ltd.; "Atlas" cement to whole of front, G. & A. Brown, Ltd.; heating, Messrs. J. Slater & Co.

Llandilo.—This proposed bank is not yet built. Hand-made multi-coloured bricks and Portland stone dressings are proposed.

Mr. F. C. R. Palmer, F.R.I.B.A., is Surveyor, and Mr. W. F. C. Holden, A.R.I.B.A., Assistant Surveyor, to the National Provincial & Union Bank of England, Ltd.

Premises for the Manchester & County Bank.

Denton.—This bank is on the site of the old bank on the corner of Market-street and the Manchester-road. The materials are brick, faced with terra-cotta, by Shaws Glazed Brick Co., Darwen. The surface is flat, *i.e.*, it has no apparent glaze, and has the advantage of good graduation in tone resembling in tint and effect Portland stone. The general contractors were Messrs. Edwin Marshall & Sons, Ashton-under-Lyne. The reinforced concrete floors and roof are by the Combined Concrete Construction Co., Manchester. The interior walls are tiled, the work being done by Messrs. C. W. Williams & Co., Manchester, and the marble flooring was carried out by Messrs. Conway & Co., Manchester. The fittings were made from the architects' designs by Messrs. Hollingworth & Sons, Patricroft.

Fleetwood.—This bank is on the dockside, where it will deal with those requiring banking accommodation near the shipping. As extensions to the docks may at some time result in the removal of such buildings as these, the problem was to provide a building of sufficient appearance with a lower cost than is usual in banking. The walls are of stock brick faced with terra-cotta from the Leeds Fireclay Co. The roof is of reinforced concrete by the Combined Concrete Construction Co. The interior is treated with a dado to the frieze line. The general contractors were J. Cryer & Son, Fleetwood.

Messrs. Mills & Murgatroyd are the architects. (Mr. A. J. Murgatroyd, F.S.A., and Mr. J. Hembrow, A.R.I.B.A.).

Bank at Basingstoke.

Mr. J. Arthur Smith, F.R.I.B.A., is the architect of the new premises at Basingstoke for Messrs. Barclays Bank, Ltd.

ably from window light. If these
are held strongly by the directors of
k for whom an architect is acting he
rn to the type of plan where the
is at the front of the bank, placed in
tion farthest from the corner. The
disadvantage of this is that the
ntrance is in a less conspicuous
s impressive position, and is likely
passed unnoticed, particularly if
lding line forces the front of the
hind the old building line, as fre-
quently happens. The advantages are already noted, *i.e.*, the teller has the window light behind him, and the customer has the light partly from above and partly on his face. The window light is also too far away to be uncomfortable to the customer. A central entrance can sometimes be arranged, but it is usually uneconomical and has certain disadvantages in plan arrangement.

One entry from the street at least should have a single shallow step only. If the main entrance requires a flight or a number of steps the secondary entrance should not have more than one—bullion has to be wheeled into the bank and steps make the task laborious and undesirably long. If the site is such that bullion has to be brought in at a different level from that of the main floor a hoist should be provided.

The principal accommodation required to be provided in the ground floor is as follows:—

The entrance and vestibule. The public space. The counter and ledger desks, etc. The manager's room. The strong-room and the entrance lobby, and stairs to the caretaker's or manager's house above the bank. If a caretaker is not to be provided, the staff entrance will be required and the lavatories; the latter may sometimes be relegated to the basement, to economise ground-floor space.

The public space—*i.e.*, the portion in front of the counter—should be as wide and important in appearance as the area at disposal can make it. That required for desks, etc., is possibly too elementary to be treated here at any length, but having obtained comfortably the area needed for staff, the full result should be given to the space in front of the counter. The ideal width will naturally depend on the size and importance of the bank, but even in the smallest banks it should be ample.

Having set the counter line, the general working arrangement must be decided. In all but the tiniest sub-branches it is necessary to provide a manager's room. This need not be large. In a small bank the manager will only occupy it for interviews and doing any strictly private work he requires. He will have other accommodation in the banking chamber in the form of a private desk. This desk should be so placed that he commands a clear view over the whole bank. Where he is by himself or acts as his own cashier he should be placed so as to command the bank entrance. Apropos of this, it is wise to give him electric communication either with the police station, if he is near one, or with the caretaker, if one is on the premises, or, failing that, a reliable neighbour, so that in the event of his being held up by thieves he can give the alarm without being seen. If in the form of an electric bell, the switch should be one which will keep the bell ringing until it is switched off again by hand.

The position of the manager's room is of the utmost importance, and it should always be placed near an entrance or the main entrance—the latter preferably. There should also be a door from the manager's room to the vestibule, so that a customer may be let out without his friends seeing that he has been interviewed by the manager. So evil is mankind that they immediately conclude that the subject of the conversation is his overdraft, and in point of fact it is so in

most cases! A customer may even change his bank if he has to run the gauntlet of his friends in coming from the manager's room.

Where there is sufficient length to the counter to allow of it there should be a way from the public space to the staff portion at each end. One of these entrances will be next to the manager's room, and can be made into a cubicle for private conversation, with a door to the manager, so that the customer can be ushered straight in if required. It will be found that the space taken by the manager's room will allow comfortably for the lobby and vestibule.

The strong-room, etc., must be ample; in the past the strong-rooms were never as large as the growing need required, and much needless expense has been incurred. Wherever possible the principal strong-room should be on the ground floor, and the floor of the strong-room on the same level as the bank. Bullion and heavy books have to be wheeled into it, and steps and slopes are a serious disadvantage. Where it is on another level a hoist must be provided.

The entrance to the strong-room should be in a direct line with the back of the desk behind the counter, or allow of an easy and straight run for the truck in every way possible. On the construction of a strong-room, although one could write chapter upon chapter, one would still fall short. Briefly it depends entirely on the importance of the particular bank. To the modern burglar any strong-room can be burgled. It is to be decided how many hours it is desirable to provide for. In a small lock-up bank, which is left unattended, one should provide for the amount of time the bank can be left unattended. It is reasonably possible to judge the time a burglar will take to break through the safeguards you provide. It might be possible to design a strong-room which would stand almost indefinitely prolonged attacks by burglars, but it would be so costly that patrols would be cheaper.

Blue Staffordshire brick strong-rooms we can only count on for a few hours. Each brick can be removed separately, and this condemns it so far as bullion is concerned. Even if laced together with steel rods, etc., unprotected these can be so easily cut by modern tools that they are not a serious obstacle.

It is necessary to combine those materials which give the greatest resistance to the modern burglar's tools in such a way that no spot is vulnerable to one weapon only. This immeasurably increases the difficulty to the thief in each case. For the ordinary strong-room, concrete and steel, mixed perhaps with some other metals (as far as may be afforded), will give the best result.

It is undesirable to use rounded smooth pebbles or stones that break with a smooth face: they can be picked out of the concrete with a cold chisel. If brick hardcore is to be used, only bricks of the type of blue Stafford, Accrington, Ruabon, or firebrick should be employed; ordinary bricks can be cut too easily.

A flat surface of steel exposed to a blow-lamp when its covering is cut away may be readily melted by an oxy-acetylene lamp. An edge of steel, protected on each side by concrete, is most difficult for the thief to attack successfully. The strong-room must be properly ventilated with one or more grids at the floor level and corresponding extract flues. These vents must be made so as to discourage the playful habit of Bill Sykes of dropping high explosive cartridges into convenient confined spaces. Such a strong-room will be proof against fire as well as thief-resisting. It should be remembered that strong-room doors are extremely expensive, and ample provision should be made in the preliminary estimate for this item.

Of late years it has become increasingly the habit of customers to leave parcels for safe custody with banks, and to deposit deeds, wills, etc., with them. Although the bank gets no revenue from this they oblige their customers, and the accommodation re for packages is often almost as great a for the actual strong-room requirements.

Book rooms and voucher rooms w required for the storage for perhaps ten accumulation. It is desirable to provi the cellar accommodation possible. An liary strong-room under the ground strong-room is often economical, or, concrete strong-room is supported by walls of blue brick, a useful book roo be made. A safe door will be require not so elaborate a one as in the case strong-room itself, as fire is the main here. A hoist to connect the ground with the cellar will be required in all t small banks.

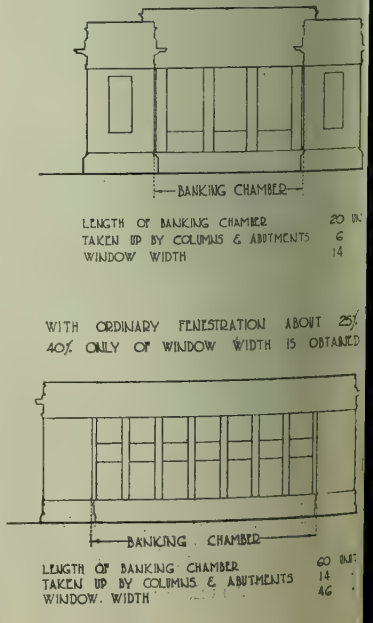
The bank ceiling should be as high sible. A better angle of light is obtaine the result is more impressive.

Columns are very fine features fr architectural point of view, but they nuisance inside a bank, and should be a wherever possible.

Some banks tile their interior walls. is better, or, if too expensive, some plaster design—of which there are ma amples. Panelling in hard wood up to gives a very rich and suitable interior fi

In this country of eternal shadow, l very important. The windows are best as high as possible, but must not come the floor than the top of a desk back and 6 ft. from the pavement. Steel window be used, and they give more window than wood.

For floors, marble slabs in the public are very effective, and wood blocks good floor for the staff's portion.



It is an economy of space to rece radiators.

It might be well to point out that t ing light is always best constructed glass roof well above the actual glass in the bank ceiling. The space betwe two should be heated in winter. In al where the writer has seen single lights down-draught and a considerable amo condensation has been caused. In mos they have to be altered. Although th seem an elementary point it is surprisin a number of these lights exist.

Treatment of Bank Elevations.

The design should convey a sense manence with dignity of conception and ment of detail.

The chief requirement governing th

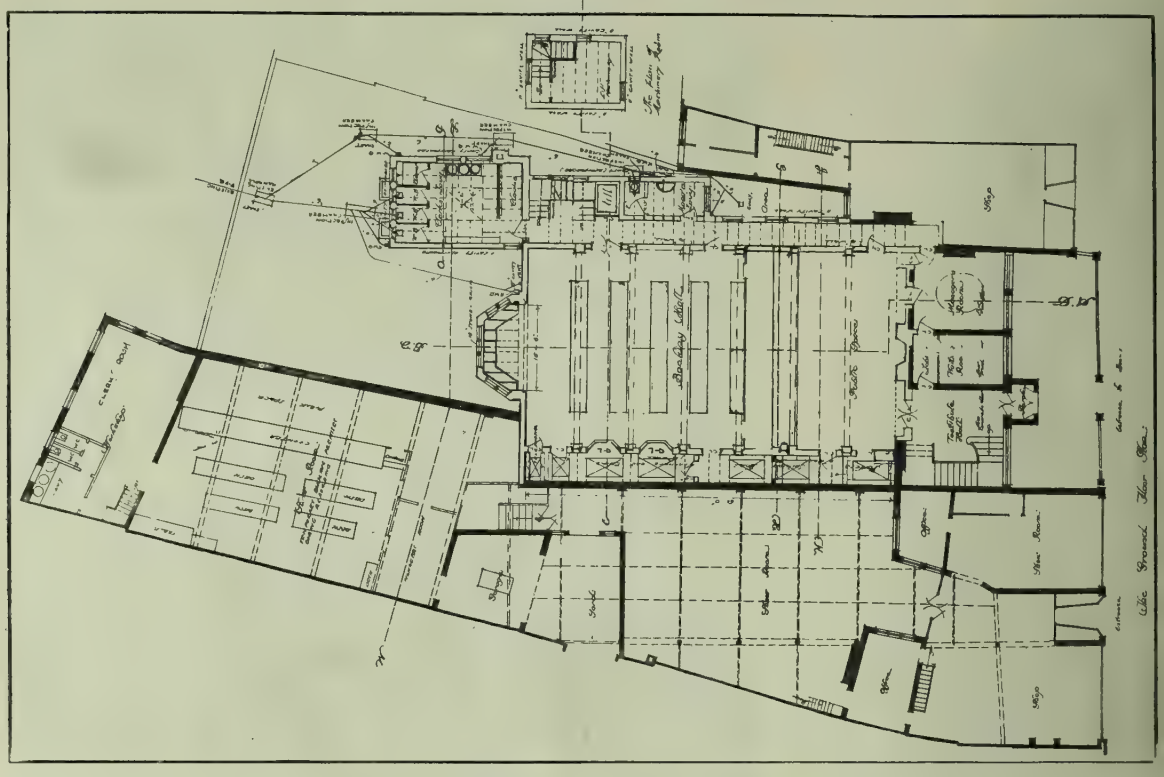
l side of design in this country is light. greatest window area obtainable is de-ble. These are conflicting needs, but they be satisfactorily solved if sufficient care thought is exercised.

ssuming that the surroundings of the pro-d bank are such that any style may be ɔted, a columniated or pilaster treatment meet both these arbitrary necessities. lighter Doric order gives very happy lts.

avilions at each end of the elevation will mmodate entrances and such stairs, etc., nay be required. The banking chamber then have a wall the light area of which ıly broken by the width of the columns or sters. In perspective this treatment will the building the dignity and importance d for in so severe a building as a bank, we have both needs provided for.

ıe diagrams on the previous page show the tment in a one-story and a two-story ding. These are diagrams, and are inten-ally not designs, but are meant to suggest eans of gaining what is desired.

Where such styles conflict with the tradi-s of a town the architect must do the best an with his problem. It is fairly easy in black and white " scheme to gain ample t, but some other styles are difficult. It be found better in these circumstances to the correct architectural treatment in the e used, and provide for the loss of windows giving ample ceiling light or light from a e. There are some very excellent examples ıis method in existence.



f course, it would not be desirable to ce banks to so stereotyped a form that become monotonous, but the individual tment of architects is so varied that it ld be almost impossible for this to come ıt. The writer is only putting forward his conclusions after experience. Where it been possible to test them they have ed effective from a practical point of view.

CLIENTS' ROOM.

ARCHITECTURE IN VIENNA.

[Contributed.]

Previous to the world war Vienna occupied high position amongst the capitals of Europe, d this was principally due to the magnifint architecture of her palaces (mostly new), e opera house, theatres, museums, monuents, and churches.

Having become the capital now of a small public, it will be difficult to maintain the rious great buildings, especially as the loss productive power and taxable capacity, gether with the general falling off in instry, owing to the decrease of territory and population, has caused poverty. Nevertheless. Vienna is still an Imperial city, with two llions of inhabitants, but without an mpire. One industry seems not to have fered, and this is banking; there is no ubt that in that respect Vienna remains one the great financial centres.

What is, therefore, more natural than that architects should have devoted themselves excel specially in this direction, and the nk buildings, inside and outside, are excelt of their kind. Naturally, in bank buildgs, beauty had to be united with economy l utility, and from the photographs an idea y be formed of the form the structures have en. (We give the Vienna Bank Union and Credit Bank, and three examples of the blic business and reception rooms in some the great Vienna banks.)

The finest structure is doubtless the building of the Austrian Credit Society. The hitects are Alexander Neumann and E. chilf. The large business room is especially beautiful, entirely constructed in marble. was finished after the war.

The rooms where the treasures, etc., are t are heavily steel-armoured and take up a ble floor. There is central heating and ht by which fresh air is pumped into all ms by electric centrifugal regulators, by ch the air is changed and renewed every r. Tubes for sending parcels, etc., connect rooms. The building possesses large and light workrooms for the clerks, bank ours, drawing-rooms, directors' offices and rd rooms, a laboratory, and a large kitchen dining-rooms.

The building of the Vienna Bank Union is t 240 ft. long and of the same width. re are five floors above ground and three ter ground, which reach 60 ft. below the et level. For the daily cleansing of the dous rooms a vacuum process is employed.

Another very fine structure is the building of the Chamber of Commerce. This was built early in this century from the plans of Ludwig Baumann, architect, with the assistance of Josef Meissner, Pietro Palumbo, Karl Felsenstein, and Christof Stumpf, and was finished in February, 1907.

One of the most remarkable features of the buildings in question are the magnificent staircases of marble and the wide landings from which the various bureaux and rooms are entered; the entrance halls are also very imposing, and generally ornamented with statuary.

It is rarely that in any great city so many fine structures are contained in so relatively circumscribed a space as in Vienna. In spite of its age, Vienna is a modern city, and only a small number of architectural remains bear witness to its interesting and diversified history. Since new buildings have been erected on the site of Roman settlements, objects were unearthed which represent Vienna's oldest history.

Mediæval architecture is also but sparsely found, a fact to be explained by the many severe vicissitudes the city has undergone; the number of sieges and the destruction following in their wake did not tend towards the preservation of ancient structures. The solid wall that served as a protection against hostile attacks and which surrounded the inner town opposed a barrier to its growth, and it was only after the removal of the bastions and moats around the inner city, which took place in 1859, that the brilliant epoch of architectural development began.

Vienna's buildings present an embodiment of the history of architecture. Though there is probably not one left dating from Roman times, yet traces of that style are visible in the oldest structures—the dome of St. Stephen's, and especially in the church of St. Michael. More numerous, however, are the buildings dating from the Gothic era of splendour. The modern architecture employed during the last fifty or sixty years is more or less unique, and has produced magnificent commercial and bank buildings.

UNIVERSITY OF LONDON SCHOOL OF ARCHITECTURE.

Exhibition of Students' Vacation Work.

The exhibition of work done by students of the University of London School of Architecture during the summer vacation, now on view in the school, shows some interesting studies in black-and-white and colour, and many sheets of useful measured work. Amongst the measured work, Leonora F. M. Payne's drawings of the Bromley room at South Kensington, and the pulpit from St. Croce, Florence, show a sympathetic draughtsmanship and excellent quality of pencil line. E. Forster has studied one of the panelled rooms at the Victoria and Albert Museum with considerable care. E. Cicely Philip presents an elevational drawing and full-size details of "Dodo House," Chichester, which provide an interesting example of English brickwork at the close of the seventeenth century.

Ebberston Lodge, Yorkshire, is shown by D. M. Micklethwaite in a delicately rendered set of drawings, supplemented by an extensive study of the full-size details of mouldings. G. T. Nicholson and H. T. Brock Griggs have both reached a high level with their water-colour sketches. G. T. Nicholson treats his work in a frankly decorative manner, which shows strength and decision in the handling and arrangement of colour. Brock Griggs' water-colours strike a more naturalistic note, and his technique is fresh and original. Some of E. Forster's pencil sketches reach a high level of achievement, while his colour work is characterised by distinct charm.

On the whole the exhibition—as an exhibition of students' work—holds a strong promise for the future.

INSTITUTE OF BRITISH DECORATORS.

On Monday last the Incorporated Institute of British Decorators held its annual dinner at Painters' Hall, E.C., under the presidency of Mr. Felix de Jong (President). Amongst those present were Mr. J. Alfred Gotch (President of the Royal Institute of British Architects), Mr. E. J. Partridge (President of the Society of Architects), Professor Rothenstein (Royal College of Art, South Kensington), Professor F. M. Simpson, F.R.I.B.A., Mr. A. B. Cowtan (Deputy-Master of the Painters' Company), Mr. C. F. A. Voysey, Mr. R. C. Gleed, F.S.A., Mr. J. M. Clark (President, Surveyors' Institution), Mr. H. D. Searles Wood, F.R.I.B.A., Mr. J. M. Ross, F.R.I.B.A., Mr. J. Oakley, Mr. R. B. Mann, F.S.I., Mr. E. S. Underwood, F.R.I.B.A., Mr. W. Stewart-Greene (Past President), Mr. T. P. Bennett, F.R.I.B.A., Mr. G. G. Wornum, F.R.I.B.A., Mr. R. H. Vigor, Mr. I. T. McArtur (Past President), Mr. Ben Carter, Mr. I. R. Chappell (Past President), Mr. Godfrey Giles, Mr. A. Sage (Principal, L.C.C. School of Building), and Mr. Englefield (Secretary).

The loyal toasts having been proposed by the President and duly honoured, Professor Rothenstein proposed "The Worshipful Company of Painters." Some of them, he said, had very strong feelings on the subject of craft education. There was a common idea that artists liked artistic things, but they did not. Artistic things as a rule were amateurish things, and amateurishness was rotting the whole of the noble industries of this country, and people looked to institutions like the Painters' Company to prevent amateurishness. It was clear that the Painters' Company was not going to trust their apprentices to professors and art masters, but was going to ensure that those young people had a thorough education. He welcomed the idea that the Company was going to train those young people, and that the apprentices would get general and vocational education together, and that the vocational education would be so sound that art schools would not be wanted at all. No one could teach the kind of art he saw at the Exhibition at Holland Park. He hoped the trainees would be kept in the industry. He welcomed the idea that certain picked students would have the chance of competing in examinations of a practical kind, which would enable them to develop their education. But when it came to a question of scholarship he lamented the kind of work he had seen and which he had been expected to admire. It was very amateurish, and could not be anything else but amateurish when artists tried to teach the decorator his business. If decoration was to take its proper place in this country they must begin at the beginning, and if they were going to decorate in the higher branches they had first of all to mean what they said. At the present time the decorator was precisely the man who believed what he did not mean. He painted every kind of archæological and historical subject, which had absolutely no reference to the vision of our own day or to the ordinary requirements of the private house or the public building. They ought to get rid of the habit of saying what they did not mean. It was thinking in styles, which meant nothing to the present generation, which was robbing the craftsman of his inheritance, which was to express the ideals of his fellow human beings living in his own age. The artist was the servant of the public, but he could only be a good servant if the mistress knew how to give orders. At present people who employed artists and craftsmen did not know what to ask for. Not only should the young people in the decorating trade be educated in the technique of their craft, but they should also be educated in sincerity, which helped them to put on the walls of our public buildings an expression of the idealism which was common to all that was best in the decorating craft. He hoped the Painters' Company would do everything in its power to educate the public in sincerity.

In responding to the toast, Mr. A. Barnard Cowtan said the Painters' Company tried to help the craft of painting. From time immemorial its work had been for the advancement of the art of decoration. He recalled that from the time of Sir Joshua Reynolds the President of the Royal Academy had always been a member of the Court of the Company.

Mr. J. Alfred Gotch proposed "The Incorporated Institute of British Decorators." Nothing, he said, could be more fitting than that an architect should be asked to propose the toast of the decorators, for architecture and decoration had always gone hand in hand. He fully appreciated and sympathised with the aims of the Institute, especially in its Travelling Studentship. The Royal Institute of British Architects had its Owen Jones Studentship for the study of colour, so the aims of the two bodies were alike in that direction.

In reply, the President appealed to decorators to join the Institute. It was his hope that membership of the Institute would be looked upon as the hall-mark of the craft, that architects employing members of the Institute would know they could place confidence in their work.

Mr. E. J. Partridge, in proposing "The National Federation of Master Painters and Decorators of England and Wales," said the crafts were suffering from a shortage of apprentices. The National Federation had an exceedingly good example in instituting a system of apprenticeship for its industry. If apprenticeship were maintained in its proper sense in each trade he felt sure they might revert to the old system of apprenticeship, and he hoped they would all seek to enlarge its scope.

Mr. C. E. Campbell responded, and said it was the aim of the Federation to bring together the whole of the craftsmen in the trade for the good of the craft. They wanted all the craftsmen in the Federation, and particularly to forward the cause of education. The first duty was to educate the craftsman, for it was obvious that operatives were now working in the trades who ought not to be there. At present the Federation was responsible for the training of about 1,000 painters in various parts of the country. In conclusion, he pointed out the advantages which master decorators derived from membership of the Federation.

Mr. W. Stewart Greene proposed "The Guests," to which Mr. W. T. Plume (Editor of *The Builder*) and Professor F. Simpson replied.

Professor Simpson emphasised the necessity for harmonious relations between architect and the decorator. Without co-operation, he said, it was impossible for decorating work to be properly carried out. The architect could design a scheme of decoration, but he could not mix the colours, and it was in the mixing of the colour in the carrying out of the scheme that the architect was dependent entirely on the decorator. He recalled that he was a pupil of Bodley, who held that the mediæval painter began by using crude colours, and then toned them down with softer colours. Bodley's theory was that later all that colouring was whitewashed for sanitary reasons, and when the whitewash was afterwards cleaned off a gloss of some transparent colour was removed with it.

Mr. Cowtan proposed a toast to the Secretary (Mr. Englefield) and Mr. Archie Campbell, who briefly responded.

New Building of the Credit-Anstalt, Vienna.
Messrs. Alexander Neumann & E. Gotthilf, Architects.

THE LATE MR. H. T. DESCH.

Mr. H. T. Desch, who died recently, was only son of the late Henry Charles Desch, was born in London in 1849. He was educ in Northamptonshire, and returning to Lon at the age of 16 was articled to the late Cubitt Nicholls, as a quantity surveyor. A completing his articles he took a post as veyor in the firm of Messrs. Wm. Cubitt & remaining with that firm up to the time o death. He took a great interest in reinfo concrete work when first introduced into country, and on behalf of his firm carried several important contracts in this form construction in London and the provinces. behalf of his firm he was associated with carrying out of many important contract London, particularly around the Bank of land, such as the offices of the Comme Union Assurance Co., Lloyds Bank, New Mutual Life Insurance Co., Scottish Wid Fund, Scottish Provident, Bank Build Grocers' Hall, &c.; also Messrs. Verners I Mills at Victoria Docks, the Cunard Buil at Liverpool, and Mount Nelson Cape Town. Some four years ago, in rec tion of his services over such a long period directors of the combined firms of M Holland & Hannen & Cubitts, Ltd., appoi him a member of the Board. At the tim his death Mr. Desch had been associated the firm for some 52 years.

Mr. Desch is survived by his widow, two and a daughter.

LEGAL SECTION.

NOTES ON CURRENT CASES.

ecific Performance : Statute of Frauds.

E case Koenigsblatt *v.* Sweet, which we y noted August 31, is now fully reported , 2 Ch. 314), and as the Courts described ase as a difficult one, upon which there was cided case exactly in point, we will refer to greater detail.

e plaintiff was the would-be purchaser of leasehold houses; the defendants, Sweet his wife, the vendors. The action was ht by the plaintiff for specific performance e contract. Early in July, 1921, a draft act had been prepared and was ready for ture, and in that contract the sale was to the plaintiff and his wife. Negotiations however, broken off on some question as nom the deposit was to be paid. Subntly the defendants instructed their ors to re-open negotiations, the clause as posit was altered, and the defendant Sweet, for himself and his wife, signed the ssment, dated July 1, 1921. The engrossso signed contained the names of the iff and his wife as purchasers, but the date npletion was left blank. The defendant's ors, through Mr. Roe, their managing clerk ot into communication with the plaintiff's ors, who had eventually intimated that the act had been signed by the purchaser and arts could be exchanged, but when the r's solicitor attended to exchange the parts y 14 the part signed by the purchaser only ned his own name and not that of his wife. efendant's solicitor, Mr. Roe, assented to lteration and altered the part signed by fendant to conform to it, whilst filling in her blanks. In his evidence Mr. Roe said nsidered he had authority to alter the ent thus to a contract for sale to the ff alone and that in an interview during evious negotiations the defendant had im the plaintiff's wife was immaterial as y to the document and that after the ent had been signed (*i.e.*, on July 19, 1921) eration had been shown to the defendant had again repeated that as regards the she was nothing," and approved the other ions, but he had said he had a better offer sired to get out of the contract. On , 1921, the defendant instructed Mr. Roe eed with the contract with the utmost h.

ie Court of first instance the matter was thus: "It is said that there is no agreen writing or memorandum to satisfy the of Frauds, because there was no contract n July 14, as Roe (the solicitor) had no ty to make a contract with one purchaser d that even if there were such a contract the defendant on July 21, 1921, assented elimination of the plaintiff's wife, there signed memorandum to satisfy the of Frauds, because to satisfy the Statute morandum must record the terms of act existing when the memorandum is

the Court below and the Court of Appeal t an order for specific performance could . The case really turns upon the ratifiy the defendant of the document signed but altered by the solicitor after signait was held that until the time when the nt ratified the agreement in his interview ently to its alteration by Mr. Roe, who him that the alteration had been the document as signed by him xplained that the same alteration en made in the document signed plaintiff, there was no contract, contract was made by the ratification e defendant not only approved of the ns, but in effect agreed that the docuned by him should be a memorandum of ntract. (See the judgment of Lord Warrington.)" Lord Sterndale explained that ratification dates back and is equivalent to an antecedent authority and the point is really explained more fully by the trial Judge in his judgment as follows: The unauthorised acts of Mr. Roe could have been repudiated by the defendant or they could be ratified and adopted by him. He adopted them and ratified them, and this ratification relates back to the time when the acts were done and the position was just as if on July 14 Mr. Roe had in his possession a document containing all the alterations but signed by the defendant after the alterations were made.

Thus, according to this ruling, there was an agreement signed by the parties and consequently without question a memorandum to satisfy the Statute of Frauds.

Workmen's Compensation : Out of the Employment.

It is some time since a case was reported in the Court of Appeal which raises the point as to whether an accident to a workman has or has not arisen out of the employment, therefore we may note the recent case of Upton *v.* Great Central Railway Co. (*Weekly Notes*, July 28).

The applicant was the widow of a man in the employ of the respondents, and on the day of the accident he was employed on a water main some distance from Dunford Bridge Station, and the report, at present a brief one, states that his employment for the day would end when on his way home he arrived at that station. He had arrived at the station before the train came in, and when the train drew up at the platform he hurried across the platform and slipped and fell, injuring his knee; septicæmia set in, and subsequently he died from the result of his injury. The platform appears to have been wet, but the arbitrator had found as a fact that it was not slippery.

The Court of Appeal held that there was no special risk of location or otherwise, and no casual connection between the employment and the accident, and affirmed the decision of the arbitrator that the accident had not happened out of the employment.

As we have said, the case is reported only as a headnote, but no point seems to have arisen as to the termination at any particular spot or time of the employment, so the case turned solely on the question as to whether the accident arose out of the employment.

Two cases, Thom *v.* Sinclair (1917 A.C. 127; *The Builder*, June 22, 1917), and Dennis *v.* White & Co. (1917 A.C. 1917; *The Builder*, October 26, 1917) were especially referred to. We reviewed these two decisions of the House of Lords at some length on the dates referred to above, and we ventured to summarise their effect as follows: "If a workman whilst performing the obligations of his employment incurs a risk which the conditions of that employment involve, and sustains an injury from that risk, the accident arises out of his employment, and that whether the risk be common to mankind or not."

In Thom *v.* Sinclair the woman in her employment had to be at a particular place, a shed, and the unexpected fall of a wall near the shed was held to be an accident arising out of her employment. This is an example of what the Court of Appeal in the case under consideration called "location." In Dennis *v.* Sinclair a boy employed by a firm of builders as a part of his duties was sent on errands in the streets on a bicycle, and he was injured in a collision with a motor car. The House of Lords held he was injured in the course of and also out of his employment, as although such a danger might be one common to the public, his duties made it an incident of his employment.

The present case is distinguishable from both the above cases, for as regards location there was nothing unusual in the condition of the platform the man had to use, it was not even slippery, and his employment did not involve the accident which he sustained. It was not a risk incident to the employment, and all casual connection between the employment and the accident was absent.

In our Legal Section, September 28, we noted a case Moore & Co. *v.* Barkey on the onus of proof in cases where a workman is killed. It was contended by the employers that the man had met his death by a breach of the Coal Mines Act by relighting a lamp, but there was no absolute proof of this, and the man was working with a night-shift foreman who was also killed. The House of Lords held that there was a strong presumption that the accident arose out of the employment, and that the onus lay on the employers of proving that the man had added a peril by contravening a statutory regulation. The test approved by the House of Lords in three cases—Moore & Co. *v.* Donelly; Fife Coal Co. *v.* Sharp, and Fife Coal Co. *v.* Fyfe (1921 A.C. 329; *The Builder*, May 27, 1921)—was "Was it part of the injured person's employment to hazard, to suffer, or to do, that which caused his injury?" Where there is no evidence to enable this question to be answered, then according to the decision in Barkey's case, if there is a strong presumption that the accident arose out of the employment, then it is for the employers to displace this presumption. In the case Astley *v.* Evans (1911 1 K.B. 1036; *The Builder*, June 11, 1911) Lord Moulton laid it down that when the last acts of a workman are consistent with the view that a workman was engaged in following his employment then it is for the employer to prove any departure on his part from his duties, and although the case Moore & Co. *v.* Barkey is at present very briefly reported, it appears that the House of Lords adopted the view expressed by Lord Moulton when he was a Lord Justice of Appeal, and gave the judgment referred to in the Court of Appeal.

LAW REPORT.

Quantity Surveyor's Claim.

In the King's Bench Division recently, before Mr. Justice Bailhache, Mr. E. D. Nixon, F.S.I., claimed from the defendants £1,150 13s. 3d. for work done by him in preparing quantities in connection with a housing scheme which the defendants desired to carry out.

It appeared from the statement of Mr. Hurst, K.C., who represented the plaintiff, that in 1921 the defendants had acquired the Lesney Farm estate for a housing scheme. It was necessary that the matter should be expedited in order to obtain the grant from the Ministry of Health before the time allowed expired. The House and Town-Planning Committee, in March, 1921, passed a resolution authorising the architect, Mr. Booty, to require a surveyor to prepare the quantities. Mr. Booty finally agreed with the plaintiff that the quantities should be for seventy-nine houses of "No. 2 type," and the plaintiff was supplied with a plan and also a form of quantities for houses of "No. 3 type." He had to make the necessary alterations to suit No. 2 type. Mr. Booty was informed that the work would cost over £1,000. When the work was completed tenders were advertised for, and the defendants wrote to the plaintiff asking him to send in his invoice on the form supplied, to which the plaintiff replied by asking for the amount of the lowest tender, so that he could answer their request properly. This was not done, and the Council wrote stating that they had not accepted any tenders, and were not going on with the scheme, and further that they were not prepared to pay the plaintiff's account,

as they considered it excessive. In the whole of the correspondence there was no reference to the fact that the appointment of the plaintiff was not under seal; nor was there any charge of negligence. The learned Counsel contended there was no need for the appointment to be under seal, as the provision of the Public Health Act, 1875, did not apply to the case. The powers of the Council originated under the Housing, Town-Planning, &c., Act, 1919. The Housing of the Working Classes Act, 1890, was adoptive only, but the Act of 1919 was compulsory. The defendants had received the quantities and taken the benefit of the work, and ought to pay for it.

Mr. Nixon gave evidence to the effect that the scale of fees which he worked upon was that supplied by the Ministry of Health's Memorandum No. 31. Mr. Booty gave him the order at an interview. After he had examined the plan he found that it was not to scale, and that that and other matters made it necessary to alter the quantities. He called Mr. Booty's attention to them; some were amended, but others were left untouched. The inaccuracies were pointed out after the copies had been received from the lithographers. It was impossible to do so before, owing to the pressure of time, since it was desired to carry out the scheme with all speed.

Mr. John Atkinson, who was Clerk to the defendant Council at the time in question, gave evidence, and said that the scheme was never approved by the Ministry of Health. Tenders were advertised for, but the Ministry had issued a memorandum with instructions that the scheme was not to be proceeded with. The Council had built eighteen houses by direct labour.

Mr. Montgomery, K.C., for the defendants, contended that the plaintiff's claim could not be justified, as there was no contract under seal. Although under the Act of 1919 there was an obligation to build houses, this obligation did not exist until a scheme had been approved. In the present case this had never been done. When, however, the work was carried out under the Act of 1890 the only powers the Council had of entering into contracts was that provided by the Public Health Act of 1875, section 174, and a seal was necessary.

Mr. Justice Bailhache, in giving judgment, said that if the plaintiff was entitled to recover, then the amount must be according to the scale in the Memorandum 31, because it was the scale agreed upon. The plaintiff did all that could be expected of him, and the defendants made use of his work by sending the quantities to nineteen or twenty builders from whom tenders were received. As to the point taken that a Corporation must contract under seal, his lordship held that an Urban District Council were in the position of a Corporation on whom statutory powers were conferred, and although the defendants were acting under the powers conferred by the Housing Acts of 1890 and 1919, their right to enter into contracts was governed by the Public Health Act, 1875, and as the contract in the present case was for more than £50 it should have been under seal. He accordingly entered judgment for the defendants with costs.

The case reported above raises a point of great importance to those contracting with local authorities. In this case a quantity surveyor, acting under the instructions of the defendant's architect, had taken out quantities in connection with a proposed housing scheme under the Housing and Town-Planning Acts, 1890 and 1919. The scheme was not carried through by the defendants in its entirety after tenders, based on these bills of quantities, had been invited, the main part of the scheme being abandoned, and the defendants refused to pay the plaintiff's account, and in consequence he brought this action.

The only defence was that the contract was not under seal, and therefore the plaintiff could not recover under it, for although questions were raised as to the scale the Court held that the scale had been agreed, and therefore if the plaintiff could recover at all the amount claimed could be recovered, but the Court held that the absence of a seal to the contract was fatal to the claim as a whole. The Court, it is true, made some observations on the charges, but this was rather in connection with the fact that the plaintiff had done the work and had recovered nothing, and the Judge pointed out that this was a case of hardship. The judgment is not yet reported in the *Law Reports* in full, and we may refer to the case again later on, as it raises some very difficult questions of law which are of great importance to those contracting with local authorities. We will first refer to the judgment and then to the cases generally on the law. Section 1 subsection (1) of the Public Health Act, 1875, enacts "Every contract made by an urban authority whereof the value or amount exceeds £50 shall be in writing and sealed with the common seal of such authority."

It was contended by the plaintiff that in carrying out the housing scheme the defendants were not acting under the Public Health Act but under section 56 of the Housing of the Working Classes Act, 1890, and section 1 of the Housing and Town-Planning Act, 1919, but the Court held that by section 56 of the former Act the local authority was endowed with the powers contained in the Public Health Acts and, therefore, section 174 applied and the contract must be under seal. Section 56 provides: "Where this part of this Act (Part III) has been adopted in any district the local authority shall have power to carry it into execution (subject to the provisions of this part of the Act with respect to rural sanitary authorities), and for that purpose may exercise the same powers whether of contract or otherwise as in the execution of their duties in the case of the London County Council under the Metropolis Management Act, 1855, and the Acts amending the same, or in the case of sanitary authorities under the Public Health Acts, or in the case of the Commissioners of Sewers under the Acts conferring powers on such Commissioners."

The finding was thus that the contract in question related to matters in which the local authority derived its powers under the Public Health Act, and therefore the point which has sometimes been raised in other cases, that the section does not apply where the contract relates to some matter outside the execution of powers directly under the Public Health Acts did not arise. We dealt with this question in connection with two cases in our issue for July 11, 1913, to which we shall refer later on. The main case relied upon by the plaintiff was Lawford *v.* Billericay Rural District Council (1903 1 K.B. 772) but that case was distinguished by the Court on the ground that there the local authority was a rural district council, which is not within section 174 of the Public Health Act.

That case seems from the short report to have been cited for a double object, first as an authority that the powers were being executed outside the Public Health Act, which we have already dealt with, and, secondly, as showing that where a corporation has accepted the benefit of a contract a new contract will be implied to pay a *quantum meruit*.

As we pointed out in our article of July 11, 1913, there is considerable doubt whether this principle of implying a contract to pay on *quantum meruit* can be applied where the contract is directly controlled by the provisions of the Public Health Act, and the two cases we there cited seem to show that, where the powers of a local authority are derived directly under the Public Health Act, then the contract must be under seal and no *quantum meruit* will be implied. The first of those two cases was Hoare *v.* Kingsbury Urban District Council (1912 2 Ch. 452). The Council had entered into a contract with the owner of a building estate whereby, if the owner gave up a piece of his land to throw into a narrow road, the Council undertook to make up and adopt the strip as a highway. The Council failed to perform their part of the agreement and in an action for specific performance it was held that the contract should have been sealed under section 174 and specific performance could not be decreed. pointed out that an action for specific formance stood on a somewhat s footing.

In the second case, Douglass *v.* Rhyll District Council (1913 2 Ch. 407), an en had been employed by the Council to ma estimate and report in respect to certain in connection with a pier. He performe work and the Council repudiated the co but the plaintiff recovered on a *quantum* although the contract was unsealed, but ground that the Council were not acting the Public Health Act but under the Im ments Act, but the Court intimated tha they been acting under the Public Healt the defence would certainly have been sus since the decision in Hoare's case.

In Baker and Others *v.* Holme C Urban District Council (85 L.J., K.B. 7 a claim by Parliamentary agents for ca a local Bill through Parliament, it was he on an unsealed contract the plaintiffs cou recover where the contract was mad carrying out the purposes of the Public Act nor on a *quantum meruit*, but tha could recover on the action for debt crea a local Act.

It may be noted that under the case considering (Nixon's case) the Cour accepted the view that, where a local authority is acting under powers co by the Public Health Acts, then section the Public Health Act, 1875, requires th tract to be under seal, and in the absenc seal neither can the contract be sued up will a contract be implied to pay on a *qu meruit* even although the goods supplied been used or the services contracted for acc

There is considerable uncertainty in th on this subject and we have indicated s the many points which have to be cons by those entering into contracts with authorities, and all we can do is to advise who enter into contracts with such auth not to run the risks of deciding for then what the law may be, but where poss insist upon sealed contracts. Such form may be irksome to those seeking emplo but as the law stands no public authority raise the least difficulty in supplying a contract when contracting with parties the fulfilment of the duties contemplate refund both time and work and sho assured of remuneration.

EGYPTIAN TEMPL

Sir Banister Fletcher delivered a on the temples of the Egyptians, at the School of Arts and Crafts, on Wed last week. He described various types o impressive ruins, with all their mag majesty and mystery. Chief in interest w normal temples, each of which was desi be approached through avenues of cr sphinxes, past obelisks and royal stat diminishing stages of gigantic pylons courts, forests of columns in the "hy halls," to the mysterious hidden sanct which only king and priests might pe In the mysterious processions and hidd the people had no part. Thus their purpo and arrangement differ vastly from temple, Mahommedan mosque, or C church. Chief among them are the tem the east bank of the Nile, in the parts of known as Karnak and Luxor, including t Temple of Ammon, which surpasses all in grandeur and gradually grew by the a of successive kings, like an English ca Here we see the first trace of the story window," such a great feature in M churches centuries later. Chief among th Pharaohs who added to these mon structures appears Rameses the Great, r the greatest builder-king but perhaps t successful advertiser in the world, si advertisements have lasted to our tin

THE BUILDING TRADE.

STIMATING FOR SMALL BUILDERS.—VIII.

By J. H. BARNS, F.I.O.B.

Electric Light.

he small builder may find it necessary on e occasions to make an estimate for wiring electric light and similar work. There are y qualities of workmanship and many kinds iring, conduits, and fittings, and the three mples which are given below are a fair cation of the class of inexpensive work in mon use.

he first and cheapest would be the steel ing with the slip joints and grip fittings, although this will meet the requirements of Fire Insurance Companies, it is hardly good ugh for a good-class job, as nails may acci-tally be driven through the tubing. The duit boxes would not be of the inspection e and the wall switch would be fixed to a d-block and not a box. The next example be of ordinary simplex screwed tubing screwed fittings. The conduit fittings ld consist of inspection-boxes, &c., and the switch would be fixed to a box.

he third example is for electric light wiring rdinary wood casing. This form of carrying work is now rather out-of-date and it is particularly cheap, as the wood casing costs ut the same as screwed tubing. The conduit ngs, bends, tees, &c., would not be required his class of work as they would be in iron ing, and the labour would be higher than wed tubing. Wood casing has to be fairly tly mitred and so on, as it shows on the ace. The customary method of estimating comparatively small works would be to rge at so much per point, which could be e by averaging the amount of the material ired for each point somewhat similar to shown below. In the case of large works matter would have to be dealt with on a rent basis.

mple :—
electric light point with steel tubing and grip fittings with switch plate (no lamps or fittings).

	£1	1	5
profits and oncosts, 15 per cent.	3	3
	£1	4	8

mple :—
electric light point as above, but wires to be run in brazed screwed tubing.

	s.	d.
20 ft. screwed barrel tubing	2	9
25 yds. 3/22 cable	2	7
Conduit fittings and inspection boxes, say three to a point, at 1s... ..	3	0
One switch and box	2	9
Proportion of cost of distribution board	1	0
Proportion of cost of main cable and tubing and main switches and fuses	1	6
	13	7
Labour, say	10	0
	£1	3	7
Add profits and oncosts, 15 per cent.	3	6
	£1	7	1

The latter example is a better-class job, and therefore the fittings cost a little more.

By way of comparison it may be noted that some gas companies will supply barrel and run to gas points at 10s. per point.

If main electric cables are required to be run in a building, the following are the rates for such work. These are based on the work being of an average class and in a new building, and for cables being run in heavy gauge conduits (usually called screwed tubing) with necessary draw-in boxes, &c., and cables of the 600 megohm per mile grade, English manufacture, N.A. quality :—

	£	s.	d.
7/22 Cables suitable for a load of approximately 10 amperes, and tube, per ft. run..			11½
Supplying and fixing one 15 to 20 ampere iron clad main switch and fuses, each	1	7	6
7/20 cables suitable for a maximum load of 15 amperes, per ft. run..		1	1
Supplying and fixing main switch and fuses. each	1	7	6
7/18 cables suitable for a load of 20 amperes, per ft. run		1	5½
Supplying and fixing main switch and fuses	2	7	6
7/16 cables suitable for a load of 30 amperes, per ft. run		1	9
Supplying and fixing main switch and fuses	2	19	0
19/17 cables suitable for a load of 50 amperes, per ft. run.. ..		3	2
Supplying and fixing main switch and fuses	3	10	0
19/16 cables suitable for a load of 70 amperes, per ft. run.. ..		3	6
Supplying and fixing main switch and fuses	4	5	0

The loads are based on 100 ft. run. Should this be exceeded, the next size of cable would be required to take the load. There is a drop of voltage on a long run of cable, and on, say, 100 ft. run this might equal 2 volts, and it is, therefore, necessary where more than 100 ft. run (or 200 ft. lead and return) of cable is required, to allow for this, which would necessitate using the next higher sized cable. A 600 megohm cable by an associated firm, being a better grade of material, would cost about 20 per cent. more than N.A. cable. If 2,500 associated cable were used, the cost would be about another 10 per cent. over cost of 600 megohm cable.

Most public authorities accept a cable equal to non-associated firms' cables, unless another quality is specified. Solid drawn tubing, which is the most expensive kind of tubing used for electrical work, costs about 30 per cent. more than screwed tubing, and would cause an increase on the overall prices (cable and tubing) stated by 20 per cent. for this quality of tube. The approximate cost of cutting chase and letting tube in flush to brickwork, and making good plastering would be 9d. to 1s. per ft. run. If the tubes were let in to surface only, and plastering made good the cost would be about 6d. per ft. run. If the wiring were being run in a dwelling house it is possible to reduce the cost of attendance on electricians, as the pipes may be run in the floor joists, &c. In that case the general attendance of other trades on electricians may cost about 1s. 6d. per point.

The builder's profit must be added to the above items.

The size of electric cable required for wiring a motor is about 2 amperes per horse power. Therefore, for a 5 h.p. motor a 10 ampere, or 7/22 cable would be required.

The cost of motors with starters and slide rails can be obtained from the various makers. The cost to fix a motor and starter would be about 15s., and this would depend upon the size of the motor, as two men must be sent to fix it, and if two men could lift the machine it could be fixed for the figure stated, but if it were a larger size and lifting tackle had to be supplied this would increase the cost. The cost of the concrete bed would have to be paid for separately, probably a medium sized foundation would cost about 20s., together with a template for holding down bolts, and it would probably be worth about 10s. to grout with cement the motor holding-down bolts and slide rails when fixed. The cost of lining up the motor so that the pulley should be in perfect alignment with the machine it is to drive would be an engineer's matter, and must depend upon the class of work which has to be done. In the case of mains only being run in a building the supply company would require distribution boards for various floors or suites. Then each tenant could have his own board and the company would seal it off when not in use. For these distribution boards the cost would be about 13s. 6d. each way (or suite of offices). The electric supply companies sometimes make a charge for bringing the main cable into the building, and the amount, if any, would depend on local circumstances.

Pembrokeshire Landowners' Association.

A Pembrokeshire branch of the Central Landowners' Association has been founded, with Mr. G. B. Bowen, Llwyngmair, as chairman and president, and Mr. Sackville Owen, hon. secretary. The branch has a membership of 200 landowners, representing an acreage of 130,000.

The Proposed New Severn Bridge.

The Glamorganshire County Council has received a letter from Sir Henry Maybery, of the Ministry of Transport, stating that he hoped the authority would support the scheme for construction of the River Severn bridge from Beachley (Mon) to Aust (Glos), and that an early start would be made to absorb some of the unemployed in the steel and iron trades. The G.W.R. Co. was prepared to promote a Bill for the necessary sanction for a jointly constructed road and rail bridge. The Ministry invited four representatives of the Glamorgan, Monmouth and Gloucester County Councils to confer with the Ministry and the G.W.R. Co. in November. The Council has appointed representatives and will support the scheme.

At a meeting held in London recently between Mr. Felix Pole, General Manager of the G.W.R., and representatives of the local authorities, agreement was reached to move for a joint bridge, the railway company to be invested with authority to select design.

THE DECORATORS' EXHIBITION.

STUDENTS' WORK

A Fellow of the Institute of British Decorators writes for us:—"For rather more than a quarter of a century the employers in the painting and decorating trade have been keenly interested in education, and have, through their local and national organisations, arranged competitions for apprentices, with money prizes, and gold, silver, and bronze medals. This sound but limited scheme accomplished much, but as it was an affair between employer and apprentice it did not go far enough. The painting and decorating trade has always sought to establish a good and friendly connection between employer and employee, and the outcome of this excellent understanding was the establishment a few years ago of the National Joint Education Committee, which from the date of its inception has been a great success. Under the control of this committee the work developed rapidly, employer and operative taking the chair during alternate years.

"The joint scheme is probably unique in industry, and some idea of its significance was obvious at the recent exhibition at Holland Park. The committee has its own secretary and staff, and the responsibility for providing funds is borne equally by the National Federation of Master Decorators and the National Painters' Society—the operatives' organisation. While this educational work is a craft affair, the public should appreciate the fact that its ultimate object is better service, better taste, better design, and a higher standard of craftsmanship. By organising these competitions, examinations and exhibitions the committee gives encouragement and a lead to every technical class and to every person desiring to raise his status, be he apprentice or journeyman. The fact is borne in mind that the better the apprentice of to-day is trained the better will be the craftsman of to-morrow. Of all the work the painting trade has undertaken for its own betterment and the improvement of its service to the public none is of more value than that which the National Joint Education Committee has been appointed to carry on.

"In the Preliminary Class of the students' exhibits, for those under 15 years of age, the subjects were free drawing, geometrical drawing and writing. The well-drawn example by A. Turner (London) seems to give all that can reasonably be expected at this age, showing as it did the ability to draw with directness and apply a wash cleanly and well without destroying the drawing. The work of the second and third prize winners was of quite a high type. It is understood that this is the first year for this preliminary section, and for a new section the work, though there is room for considerable improvement, is very creditable. In the writing (lettering) class much really creditable work was submitted, the letters being well drawn, but, no doubt through lack of practise, many did not seem able to apply the black with that directness that is required.

"In Class I (age 15–17) there are five sections, including a compulsory theoretical examination. The plain painting shows that a great deal of attention is given in the schools to the kind of work that 95 per cent. of operative painters are engaged upon. This work, by boys so young, is excellent and comparatively much better than that in any other class. The green panels of all the prize winners were excellent examples, and the competitors had mastered the difficulty of applying flat paint and varnish to advantage. There were, however, sections (and these appeared to classify themselves into schools or areas) where the preparation of the board was poor, and work indifferently done with poor material. The boys should have the best equipment and materials possible if they are to secure the greatest amount of good out of their training. The lettering for boys so young was very well done, and the drawing in this class is encouraging, though more experience is needed in regard to the application and value of colour. This, however, may not be altogether the fault of the boys; the experience of another year of practise will, no doubt, make a wonderful difference.

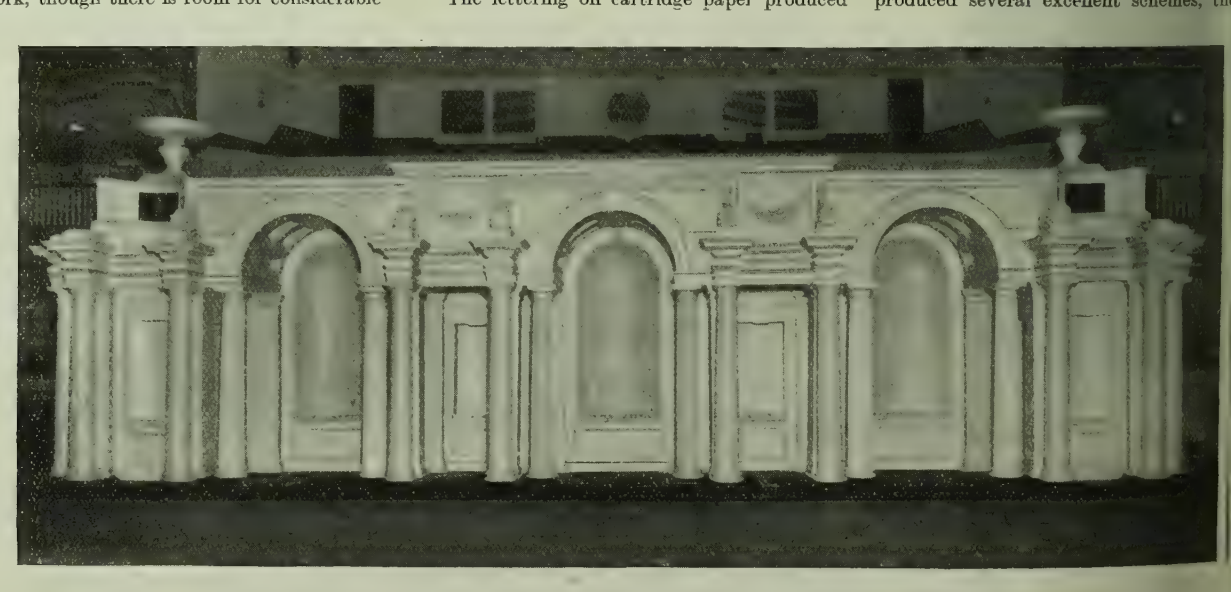
"In Class II the work generally is not of so high a standard as in Class I, though it shows a variety of work which, if conscientiously carried out, should give good results. One is glad to notice the colour schemes requiring boys to suggest plain colour treatment.

"The fact of the first and second prizes going to Leicester suggests that at this school colour is handled with understanding, as the result of sound instruction. It is realised that the subject is a difficult one for boys so young, but if right-guided practise is obtainable it should be of great value to the trade, in which colour is so all important. The candidates generally, though they place suitably contrasting colours together, fail to realise the importance of the room. The work of the winning candidates showed a masterly handling of both the paint and the varnish.

"The two subjects for lettering each set its own peculiar problems. The first prize was awarded to S. B. Gomersall (Morecambe) for two really beautiful examples. One noticed, however, that they were slightly weak in the width of the stroke. In both sets the execution was admirable. The lettering generally was good.

"The lettering on cartridge paper produced only a few good examples. One feels, ho that the student is severely handicapped the paper ground. The problem seems uns calling, as it appears to do, for treatmen poster materials; the question should c state what material should be used.

"Plant form resulted in few examp distinction. The candidates do not app know how to prepare these studies in th that is necessary if they are to be used aid in design. Much of the detail, even carefully drawn, is buried in colour and A comparison of last year's results di the fact that the winning candidate is the and he is to be contratulated on his conti success. A. Garner (Stockport) submitt cellent work, and should go far with a year's experience.



"Much of the work in the section for s ling was well executed but lacking in kno of design. The winning work, thoug sombre colouring, was well drawn and g its conception; the work placed secon exceedingly good, though rather too chopped up, the detail being small.

"In the graining section there was work that was clean and well-executed. would, however, like to see a more close re ship between the time test and the work d the student's own time. There were examples that were slavish copies rathe showing skill in the use and manipulat the tools. The above remarks apply equa marbling. The lining question places un sary difficulties in the way of the candi One cannot help thinking that a more su surface than paper should be used; ingenuity will be required to deal wit difficulty, but it should not be impossib question set as this is can never give th results.

"The colour matching set a really proposition and the results are very good wonder how many journeymen would do well? The students' example should nearly as possible the same size as the s given. F. Pilling gave an admirable se of carefully matched samples.

"In Class III (age 19-21) many really examples of work were produced. The books, which were few innumber, it is stood, were weak, but the cards showir evolution of Renaissance ornament were interesting. That by the first prize A. E. Holgate (Manchester) was very well as also that by L. G. Taylor (London) the of the second prize; the sketch book (w compulsory) should be a well-filled boo just a few sketches rushed through fo purpose of qualifying in the section; th no doubt whatever that the three w candidates rightly earned their reward.

"The coloured drawings for the villa produced several excellent schemes, the

Stand at the Decorators' Exhibition. Designed by Sir Edwin Lutyens, R.A.
[This stand was used by the British White Lead Makers for the display of waterproof sandpaper.]

g candidates producing excellent schemes. uld suggest, if they could obtain facilities r schools, they should execute a portion scheme full size. The candidate who ced combing had failed in the develop- of his elevation; his full-size detail a masterly understanding of the limits e of the steel combs in this type of work. nt form produced excellent work, g evidence of careful work, but the ng of the plants would be more helpful pictorial rendering of the subject. It be borne in mind that the sketches are minary to design. One could not help g that the candidates' numbers were ted in many of the sections, which goes to iat they are a hard-working lot of boys, the trade should strive to keep. It not be necessary for them to seek other not so closely allied to painting and ing.

ornamental painting competition was mpted by a large number of candidates. t prize was awarded to E. Provost (Leek) od piece of work in fine colour. J. L. (Huddersfield), who has proved his by his many successes, was awarded the prize; his work was excellent, as also t of C. J. Butcher (Southend).

words 'Historical Styles' were set for g on cartridge paper. The few examples od, and under the circumstances these tes did remarkably well, for many sign- of experience would much dislike a of this type. Mr. Brooke (Hudders- as again the winner of the first prize. ion produced some excellent specimens. he Rough Panel the students were set lt task, and acquitted themselves well. l be clearly understood that if a student re than he is asked for he may be defeat- bjects of the question; lines and other are unnecessary when used as a means ng the varnished edge, which should be ight. The third prize was not awarded. s IV, devoted to journeymen, generally work that is relatively not of a ndard. There are individual examples that the student is a clever craftsman, ill (London) and J. B. Topham (Harro- ning three prizes each out of 24. It is, possible they only entered in three each.

e ought to be a greater number of om journeymen painters, for they, as any, require to practise, especially in tions where there is less demand. The nting was not all tha it should have is to be hoped that amongst the many en who visited the exhibition there me who will realise that the system of boys will produce a much higher of journeyman craftsman whose ability may set a new standard of nt. Colour matching for journeymen an excellent innovation. One is filled piration by the examples of the now colour combing and scumbling; the f exhibits is gratifying, the quality of very encouraging. There are great real revival of colour treatment, which much to enliven the many surfaces ith meaningless treatment. The first awarded for a very simple and clean els, executed by H. J. Okill, who was cessful candidate in the plain painting ing sections. G. H. Hutchison (Man- nd Z. Sandford (Halifax) were second l respectively, both with good and kamples. There were several sets to would liked to have given prizes. e section for perspective sketches some examples were submitted—truly our en have much to learn.

ally, the impression one gained was younger the boy the better was the here was very little evidence of a know- he use of colour, or any real apprecia- e importance of sound preparation and erial. The National Joint Education e has a great task and an excellent y of training a type of craftsman who better service to the public. May the es quickly emulate its example."

RATES OF WAGES IN THE BUILDING TRADE.

(For rates of wages in the Building Trade in Scotland, see page 666.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations :—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERGELE.—At the last meeting of the Council Messrs. W. H. Jones & Son, Penybont, sent in a plan showing the lay-out for housing purposes of the land at Pentre Nehaf. The surveyor said the plan showed sites for 59 houses, including workmen's houses in blocks of four, and some semi-detached villas. It was proposed to apply for the £75 subsidy in respect of each of 20 houses proposed to be erected in the first instance.

ARDSLEY.—Plans passed :—Bungalow at Bradford-road, East Ardsley, for Mr. D. Knighton.

ASHTON.—Subsidies under the new housing scheme have been approved by the Council in respect of 16 houses in Abingdon-street, 18 in Montague-street, and 16 in Burlington-street, for the Co-operative Society, and in respect of four houses in Thornfield-avenue, to be built by Messrs. J. Ridyard & Sons, Ltd.

BARNARD CASTLE.—It is proposed to demolish the old business premises at the corner of Newgate-street and Market Place, Barnard Castle, to widen Newgate, and to erect new buildings, including a parochial hall and premises for the use of parish workers, on a building line set back considerably from the existing line. The architect appointed is Mr. R. Wylie, A.R.I.B.A., of Newcastle.

BARROW-IN-FURNESS.—It is proposed by the Education Authority to proceed with the erection of at least one wing of the new secondary school, and also the extension of the technical school.

BEOCLES.—Plans of a house in London-road, for Mr. G. A. Dunn; a bungalow near Ballygate, for Mr. V. O. L. Walpole, and for a house in Grange-road, for Mrs. A. R. Scott have been approved by the T.C.

BEDWELLTY.—The U.D.C. has applied for sanction to erect 100 houses.

BELFORD.—The R.D.C. has passed plans for five cottages for W. Tully & Son.

BIRKENHEAD.—Plans passed by T.C.: Two pairs of semi-detached houses, Bedford-drive; two pairs of semi-detached houses, and three houses, Lingdale-road North.

BOLTON.—Plans passed by T.C.: J. Chadwick & Bros., Ltd., two houses, Springfield-road; Rev. W. Leighton, Memorial Chapel, Pilkington-street; Dart Mill, Ltd., engine house and rope race, Alexander Mill, Wolfenden-street; A. Coward, two houses, Withinslane; George Partington, bungalow, Chorley New-road; Ashworth Bros., six houses, Thurstane-street; J. Latham, two houses, Regent-road; Crosses & Winkworth, Ltd., strong room, Lever-street; Jos. Rothwell and R. Hampson, two bungalows, Doe Hey-road; J. Simpson and A. S. Ryan, two bungalows, Doe Hey-road; John Archer, four houses, off Colenso-road; Leigh Bros., seven houses, Cloverdale-square; J. C. & F. Woods, lay-out plan, East Bank Estate.

BRAMPTON.—The R.D.C. has approved plans for the erection of a pair of semi-detached concrete block cottages, near Easby-lane, for Mr. C. H. Roberts, M.P., and a pair of houses of similar construction on Capon Tree-road, for Lady Mary Murray.

BRIDGEND.—Plans passed by U.D.C.: Four houses, Ewenny-road, Bridgend, for Mr. T. Davies; house and shop at Grove-road, for Mr. Lewis Edwards; two lock-up shops at Cemetery-road, for Mr. Richard Relsat; house at Grove-road, for Mr. T. King Davies; storm water sewers at Merthyr-mawr for Bridgend U.D.C. Plans of improvements to Rhiew Smithy for Mr. Ivor Thomas were deferred a month for amendment. The Ministry of Labour has sanctioned additional loans by Penybont (Bridgend) R.D.C. for carrying out Pencoed and Coychurch sewerage scheme providing labour taken from Exchanges. The Penybont Council has received estimate from Surveyor for Penyfai sewer scheme, at £2,500. The Penybont Council will put in hand at once erection of 12 parlour type houses and eight non-parlour type at Sarn, at total cost of about £7,200.

BRIDGWATER.—Plans have been approved for 29 houses for various private builders.

BRIGHTON.—The T.C.'s scheme for the improvement of certain portions of the Kemp Town area has been the subject of an inquiry by Mr. W. H. Collin, an Inspector appointed by the Ministry of Health.

BUILTH WELLS.—The County Main Roads Committee has received estimates for proposed new bridge at Builth. A reinforced concrete structure with masonry parapets is estimated at £10,000, and masonry bridge at £8,000. The Ministry of Transport is being interviewed on matter. It is also proposed to reconstruct the Erwood bridge.

BURNLEY.—The Maternity and Child Welfare Committee of the T.C. propose alterations to the house, 1, Colne-road, for adaptation as a nurses' hostel, and to adapt portions of Bank Hall Maternity Hospital to provide more accommodation.

BURY.—A meeting of the Unemployed Committee, held to consider work for the unemployed during the coming winter, resolved (a) that the Committee visit the Clarence reservoir to consider whether to recommend the Council to construct an open-air bath adjoining the reservoir, and (b) that the Mayor, Town Clerk, and the Borough Engineer interview Lord Derby's agent with respect to acquiring the plot of land between Wellington-road and Parkhills-road, on which the gravel mound stands. The B.C. have appointed a sub-committee to inquire into installing a system of central heating at the Union Offices. The Bury Paving Street, &c., Committee have approved plans for the erection of four bungalows in Ainsworth-road, 18 houses in Wellington-road, and 18 houses in Horne-street.

CAERPHILLY.—The U.D.C. is to acquire land for following works: (*a*) Near Mountain-road and King Edward-avenue for Council offices erection; (*b*) east of Cardiff-road for erection of public lavatories, &c.; and (*c*) near Station-terrace for construction of 'bus service waiting rooms and shelters, &c. The official investigator for the Miners' Welfare Fund Committee, London, has inspected sites for recreation grounds' laying-out at Senghenydd and Aber, near Caerphilly, on which it is proposed to spend £15,000. The secretary is Mr. William Morgan, Abertridwr.

CAMBRIDGE.—Plans passed by T.C.: House, Highworth-avenue, Mrs. B. A. D. McWillie, 160, Gwydir-street; two pairs of houses, Leys-road, Ginn & Son, 14, Victoria-road; house, Milton-road, Mrs. Holland Watts, 98a, Mill-road; offices and dairy, Abbey-street, Arnold Bros.; bungalow, Vinery-road, F. C. Watts, 6, Pretoria-terrace, Ditton-lane.

CARMARTHENSHIRE.—The Llandilo R.D.C. has received applications from 355 persons for subsidy assistance to build houses, and has decided to grant 100 persons assistance and has applied to Minister of Health for sanction to leave the Saron building site for the constructions. The County Standing Joint Committee is to improve and repair Llandilo Town Hall.

CATFORTH.—A sub-committee of the village club has been formed to carry out proposed extensions to their Institute. Plans have been prepared by Mr. W. D. Glencraig.—HOUSING.—The Kirkcaldy District Committee of the Fife County Council has received the Board of Health's approval of the acceptance of the tenders for the erection of 38 houses at Glencraig amounting to £13,252 17s. 1d., subject to certain conditions.

Greenock.—BATHS AND FIRE STATION.—Plans have been prepared for swimming baths and a new fire station at the corner of Rue End-street and Dellingburn-street, Greenock.

Bonnyrigg.—HOUSES.—The T.C. has decided to erect a tenement of 16 houses of three rooms and eight houses of two rooms. The site proposed is in Polton-street.

Ayr.—HOUSES.—The T.C. are going to apply to the Board of Health for sanction to erect 50 houses.—The Dean of Guild Court has passed the following plans: Double cottage in Ashgrove-street, for Mr. R. Stewart, George-street, estimated cost £1,600; two houses in King-street, for Mrs. M'Mahon, King-street, £1,000; cottage in Ardlui-road, for Miss King, High-street, £1,100; cottage in Ardlui-road, for W. Govan & Sons, Prestwick, £1,400; and six houses in Bellesleyhill-road, for Mr. Clark, Ayr, £4,800.

Edinburgh.—OFFICES, &C.—The Dean of Guild Court has passed the following plans: Mr. D. Alexander, offices and sheds at West Savile-terrace; H. W. Brierly, a bungalow and garage at Bonaly, Colinton; Mr. W. Peterkin, bungalow at Brumbrae-road, Corstorphine; the trustees of T. Thomson, workshops at Straiton, Loanhead; the Portobello Co-operative Society, bakery at Tower-street, Portobello; Mr. D. M'Bain, four cottages at Longstane-road; and eight houses at Clark-avenue, for the Corporation.—The Housing Committee recommends the Corporation to build five-roomed houses to sell to tenants on the instalment plan.

TENDERS.

L. CXXV.—No. 4213. NOVEMBER 2, 1923

CONCERNING COMPETITIONS.

THERE appears to be a general consensus of opinion among architects in all parts of the Empire that the present system of judging public competitions is defective, and that the whole question of the conditions and method of assessing such competitions should be reviewed fairly and impartially in the light of recent experience, and an endeavour made to find a method which shall be more in accordance with modern requirements.

It is somewhat singular, in view of this general interest in the subject, that those who have recently expressed their views (in our columns and elsewhere) do not appear to be acquainted with the paper on *The Evolution of the Architectural Competition*, read by Mr. H. V. Lanchester at the R.I.B.A. on January 7, 1915. For this reason we propose in our next issue to give a summary of the paper, which we feel will be welcomed by our readers as an impartial review of the whole subject by one who has considerable experience, both as competitor and as an assessor. It is not without reason that Mr. Lanchester opened his survey with an extract from the introduction to the seventh book of Vitruvius, although it deals not with architecture, but with the kindred art of poetry. The passage is well known, and recounts how Aristophanes (who had previously spent much time in the celebrated library at Alexandria) assisted the judges appointed to make awards in a contest of poets. When the judges were required to decide, although them agreed to award the first prize to the competitor who had most pleased the assembled multitude, and the second prize to some other candidate. The opinion of Aristophanes was required, he observed that the best poet had pleased the people least. So convincingly was he able to prove his contention that the two competitors applauded by the people had stolen their verse from existing works, that not only did they forfeit the prize, but the king ordered them to be proceeded against for theft, and dismissed them with ignominy.

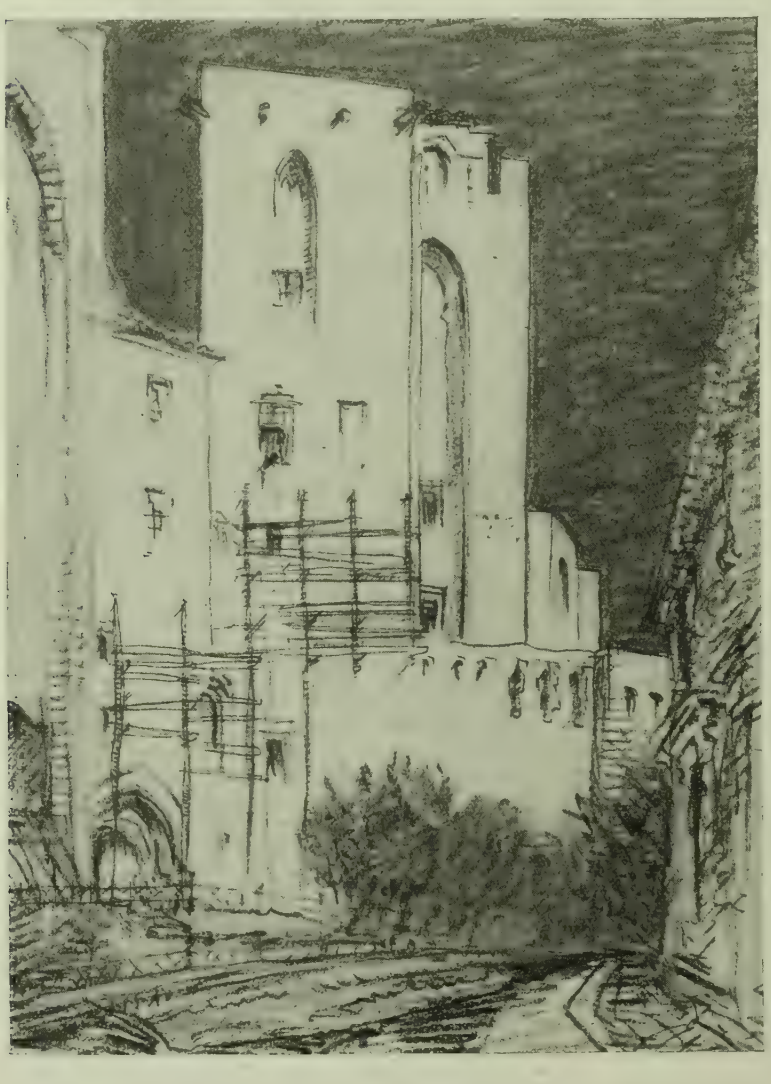
At first sight it might appear that the application of this illustrative story to modern architectural competition is not very close. Considered more carefully, we feel that it goes to the heart of the matter; we observe, firstly, that the judges based their (proposed) award, not on knowledge, but on their own judgment, but on popular approval; secondly, that the competitors applauded by the multitude relied, not on their own ability, but on a skilful plagiarism of the work of others, selecting, no doubt, those who had been successful at previous contests; thirdly, that the courageous action of Aristophanes (though at first received with surprise and distrust) eventually obtained the support of the king and the populace, because it was seen to be based on knowledge, and was supported by an impartial survey of the relative merits of the work of competitors in its relation to the conditions of the competition.

This exactly expresses what we feel to be the chief difficulty in public competition of the present day. A good case can always be made out for the assessing of all competitions by a single man, but the justice of their award will ultimately depend on the knowledge, experience and courage of the assessors, on the manner in which they have drawn up the programme or "conditions," and on their elimination of all competitors who have not complied with these conditions. So long ago as 1829 a committee appointed by the R.I.B.A. to consider the matter expressed the view that "whatever the conditions may be they ought to be clear and explicit, that the competitor may know precisely and unequivocally upon what he has to rely. Whenever it may be expedient to lay down definite instructions they ought to be strictly adhered to, when judgment is to be founded upon them, and every design rejected which shall not be found to conform to them."

It is evident that if this pronouncement had been strictly observed by assessors their awards would not so frequently have been received with a considerable volume of hostile comment, and, in all probability, there would have been no great demand for a change in the existing system of a single assessor nominated by the President of the R.I.B.A. We can all call to mind competitions which have been satisfactorily assessed and in which the awards have been endorsed by a majority of the competitors themselves, but because the award has been accepted as a fair and impartial one it does not come into so much prominence as in those cases where criticism of the assessor's judgment can be justified.

At the present time the difficulties of the single assessor are increased because—under the existing system of nomination—he is frequently one of those who belong to what we may call "the Elder Statesmen" of the pre-war period of architecture, and "whose outlook," as a correspondent expresses it, "and habit of thought in architectural composition are along entirely different lines from that of the younger generation, who form the majority of the competitors. He is, consequently, incapable of drawing up a programme in such a form as to fire the imagination of the younger architect, and is handicapped in his judgment of the work sent in by not being in touch with the new ideals which to-day show such well-marked lines of cleavage from the accepted standards of pre-war days."

It appears that the jury of assessors is preferred by all, or nearly all, of those who have taken part in the recent correspondence in our pages to the system whereby the decision in any important public competition is left in the hands of a single architect. It is noteworthy that for other important architectural contests, such as the Rome prize, the awards made in the schools of architecture, and in the architectural "ateliers," there could be no suggestion of a single assessor, so firmly is the principle of the jury established. This is largely due to the excellent work of the Beaux Arts Committee, which has consistently advocated the advantages of the jury system for many years and has demonstrated the fact that it is a workable scheme.



We feel, therefore, that in the interests of the profession, the Institute (whose powerful influence has so often been wisely and successfully used to obtain from promoters of architectural competitions conditions such as have generally inspired confidence in competitors themselves) should, in the light of recent experience, review the whole question of the regulation of competitions. The matter might possibly be referred by them to an impartial body, such for example as the recently constituted *Franco-British Union of Architects*, whose members comprise many distinguished architects well acquainted with the merits and defects of the various systems of assessing competitions both in England and France. Any report by such a body would have considerable weight and would, no doubt, be of assistance to the Institute, to whom the whole profession looks for a clear statement on this difficult question.

NOTES.

Lack of Skilled Labour. With a building programme in Birmingham extending over twenty years there seems little likelihood of unemployment there, yet Sir Montague Barlow—as we report on p. 695—had to deplore the lack of skilled building workers, as pointed out to him by a deputation from the Birmingham City Council on Tuesday. The lack of bricklayers obviously affects directly the employment of labourers, who number 2,000 out of the 2,300 unemployed building workers in Birmingham. The lack of a continuous supply of trained apprentices is a serious matter and we think parents are much to blame in overlooking the advantages possessed by the skilled mechanic. It is surely a curious fact, notwithstanding the promise of long-extended activity in building work in Birmingham, that no definite steps are taken to provide an adequate supply of the needful workers.

Preservation of City Churches. Nothing could be more untrue, says the City Churches Preservation Society, than the statement that the City churches are no longer able to fulfil the purposes for which they were built and are therefore of no further use. Many of them minister to a far larger day population than when they were built, and surely all of them are capable of being put to good use. We do not think the case for providing churches for suburban use out of the sale of City churches is clearly established. It is easy to destroy a number of old sacred buildings, but we venture to think there is a large and potent opinion against such a course.

Architecture for the General Public. There is probably no better way of gradually improving the prospects of architectural design than a more extended and intimate knowledge of it by the general public, and we are therefore glad to see attention again directed to this consideration. In a reprin paper read in 1906, Sir Banister F urges a definite acceptance o general architectural study in the lum of students' work, whethe aim to practise as architects Everyone knows how the rem building all the world over remai as vivid pages of the world's Whilst no realisation of fine ora singing and no triumph of d art remained to us from all the doings up to a few years ago, we realise the values of ancient archi art, both on the ground and b from China to Peru. The chara peoples is indelibly stamped upo buildings, and some day the wid worship of the dollar will be ine illustrated by our precedents a remains of present-day structure cannot do better than quote a pa of the writer's remarks, as f "Architecture has been the press of all periods. Architect more particularly entitled to the at of the general student than an of the Fine Arts; because it ca action so many and such varied b of mechanical labour, and b operating thus extensively upon in it also promotes national pro Hence the dissemination of a tast amongst the middle as well as th opulent classes of the State is n sound national policy, but also im as likely to lead to more direct ar obvious artistic results."

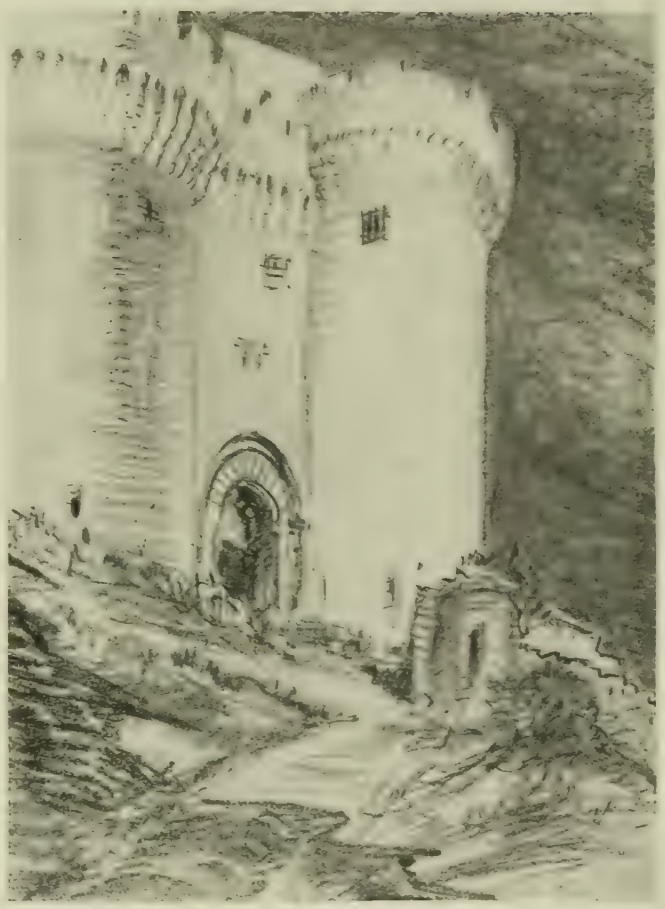
British Museum Lectures. These lectures on excavations, contin Miss Clare Gaude sustain the interes which they were inaugurated. by the admirable photographs sh the screen, the audience is give an intimate contact with ancient tions, which reveal in their deta that is of interest to the preser such as the photographs from t Sumurian period illustrating the the expansion joint in buildin Sumurians, in the mounds on w cities were built (from 40 to 70 f used sunbaked bricks in the cer kiln burnt on the outside, and b drains in horizontal courses with radiate arches, and for the smalle large bricks were placed in a tria in pitch. To preserve the ced beams they soaked them in and we may observe how effect soaking was in their being able the death watch beetle for su periods of time. The lecturer d how at Ashur some vaulted c of burnt brick were found wit doors, which proved to be the t the kings; these were found to h

lered in ancient times, as, indeed, most of the Egyptian tombs. Photos of the fortifications at Ashur, rated by the Germans before the are said to have influenced the ing of the Hindenberg line, the ans making use of the knowledge acquired. Whether so or not, one to see that human nature at any in the oldest civilisation or in that day, reveals much that is common civilisation.



Wealth.

In the difficulties of the time there is a call for the creating of new wealth, and ave heard attention directed but tly to the necessity of doing so. is plenty of scope, which should l particularly to the more thought- us in raising the standard of our tries, as well as the extent of them. is an opportunity for a commercial macy in securing that our industrial re the best in the field, and in order ieve that there must be appreciation e need for more experiment, more ture. The timidity that holds to ld commercial ways is unequal to ask of penetrating our industries new values, and will, we hope, be seded by a spirit of more enlighten- which recognises to the full the tance of art to industry, and under- s something of the best means of g them closer together. In such a we may so increase the esteem for dustrial art that it will derive that macy which merit confers on it, reate the new wealth we so much

---

The oration f uman lues.

It is not perhaps sufficiently recognised that there is a waste of resources under the pressure of industrialism, which withstands progress, hat to increase the percentage of n value—in fact, to get more out nan than the 20 per cent. of indus- m—is a sound economic proposition. resent state of things is as though d a factory full of machinery and ted to use more than a quarter of When stated, it appears almost l that this waste of human values l continue without more notice called to it. Our industries need the ment of this unused source of new n. and freeing labour to a more gent use of itself will do more than rther entrenching of industrialism present lines. The question, there- s of concern for all of us, as to what cations are possible to industry in to increase the percentage of human in each man, which liberates more n to intelligent labour. And in finding the solution, we should also find what was missing in order to restore art to industry.

Entrance to the Chateau, Villeneuve, Avignon.

From a Sketch by Mr. Stanley Hamp, F.R.I.B.A.

Stowe Avenue.

The public-spirited action which intervened at the time of the sale to delay the passing of Stowe-avenue is now, due to the liberality of old Etonians, likely to succeed in preserving these beautiful trees, which will become the property of the school, though the chief credit is due to Mr. Williams-Ellis in the first instance, who, by his generous thought for the public welfare, saved them from destruction. With so many of our finest country places changing hands, every care should be taken that, under the new conditions, their features, which are so much a part of our inheritance of beauty, should be spared, endowed as they are with so many associations. Though it would not be fair to suggest, as is too readily assumed, that we are more neglectful of preserving the past than our predecessors, for discoveries are often enough made showing traces of earlier beautiful architecture replaced by the fashion of a later time, it would be truer to say that at all times there has been vandalism and that the present age has to set a better example. One may cite here, as an instance of that violation of the past carried on to present times, the case of Winchester College Chapel, which, from the time of the barbarous removal of the Grinling Gibbons' panelling, has been subject to one restoration after another in a restless spirit of change.

The A.A. School.

An admirable quarto pamphlet has been issued illustrative of the work of the Architectural Association School of Architecture, in which the many-sided activities and advantages of the School are graphically set forth. The frontispiece is appropriately a reproduction of the School Diploma granted to those who have passed the five-year course, followed by six months in an architect's office. It should be remembered that admission to the school is not confined strictly to architectural students, but is extended to those entering any of the arts, professions, or businesses connected with building. The twenty-five pages of illustrations of students' work, including two well produced pages of colour work, will be found worthy of note.

GENERAL NEWS.

Professional Announcements.

Mr. F. P. Ferguson, architect and surveyor, has opened an office at 38, High-street, Buckingham, and will be pleased to receive manufacturers' catalogues.

Mr. R. Gerrard Forbes, M.S.A., architect and surveyor, of 540–543, Abbey House, Victoria-street, Westminster, S.W.1, would be pleased to receive trade catalogues.

Mr. Thomas Gibb, M.S.A., has taken into partnership Mr. Edwin Smith, A.R.I.B.A., P.A.S.I. The firm will practise as Gibb & Smith, architects and surveyors, at Post Office Chambers, Port Talbot (telephone 70), and Borough Chambers, Neath (telephone 329).

Appointments.

Mr. Arthur Storer, engineering and town-planning assistant to the county borough of Grimsby, has been appointed building inspector to the Borough of Chesterfield. There were 137 applicants for the post.

Mr. Percy Parr, of 30, Merches-gardens, Cardiff, who, for the past three years, has been an assistant to the City Engineer at Cardiff, has been appointed senior engineering assistant to the Rotherham Corporation. Mr. Parr came to Cardiff direct from the Manchester University, where he took his B.Sc. degree with honours.

Mr W. H. Gibbons, teacher of building construction at the Altrincham Technical School, has been appointed one of nine building construction teachers to confer with the Lancashire and Cheshire Institute on their building construction syllabus.

Honours and Presentations.

The highest honour it is in the power of the architectural profession in France to bestow, the Grand Medaille de Société des Architectes diplomées par le Gouvernement Français, has been awarded to Mr. John W. Simpson, Past President, Royal Institute of British Architects joint architect of the British Empire Exhibition, and author of "Essays and Memorials," recently published.

Mr. T. F. Harvey, for 27 years engineer and surveyor to the Merthyr Tydfil Board of Health and Town Council, and since 1912 the waterworks engineer to the Council, was the recipient of an illuminated address from the Council in appreciation of his 37 years' service, at a meeting held on October 23. Mr. Harvey has been transferred to the Taff Fechan Joint Water Board, to whom he will act as engineer.

At the General Purposes Committee of the Huddersfield County Council it was resolved to invite Alderman Joseph Berry (of Joseph Berry & Sons, architects, surveyors and valuers) to accept nomination for the office of Mayor of Huddersfield for the ensuing year. Alderman Berry accepted the invitation amid applause. The election will take place on Mayor's Day, November 9. Ald. Berry entered the Town Council in 1899; was made an Alderman in 1912 and a Justice of the Peace in 1920.

"Anne Hathaway's Cottage."

Messrs. W. H. Smith & Son inform us that the building they have restored at Stratford-on-Avon is not Anne Hathaway's cottage, as stated in our issue for October 19. The building referred to is No. 1, High-street, Stratford-on-Avon, which is some considerable distance from Anne Hathaway's cottage.

R.I.B.A. Inaugural Address.

On Monday next at 8.30 p.m., the President of the R.I.B.A., Mr. J. Alfred Gotch, F.S.A., will deliver his inaugural address, and the portrait of the Past-President, Mr. Paul Waterhouse, which has been painted by Sir William Orpen, R.A., will be unveiled and presented to the Royal Institute, and the R.I.B.A. medal and diploma for the best London building completed in 1922 will be presented to Mr. W. Curtis Green, A.R.A., for Wolseley House, Piccadilly. The meeting will take place in the hall of the Royal Society of Medicine, 1, Wimpole-street, Cavendish-square.

St. Paul's Cathedral.

At the invitation of the Northern Architectural Association, Mr. Mervyn Macartney, B.A., Surveyor of the Fabric of St. Paul's Cathedral, delivered an address at Armstrong College, Newcastle, on the history of the building of St. Paul's and upon recent works of repair and restoration. After discussing the first building of the cathedral and the vicissitudes through which it passed subsequently, he described the reconstruction by Sir Christopher Wren, a work which occupied thirty-six years. Mr. W. T. Jones, of Sunderland (President of the Association), occupied the chair.

Littleton Pumping Station.

Occupying altogether a site area of over 20,000 square feet, the new pumping station at Littleton is designed to house the largest single pumping plant yet installed by the Metropolitan Water Board. The designs for the new buildings were prepared by the architectural staff of the Metropolitan Water Board, under the direction of Mr. Henry E. Stilgoe, M.Inst.C.E., the Chief Engineer. An inclusive contract for the whole of the structural work, to cost £70,312, has been placed with the firm of John Laing & Son, Ltd., of Lincoln House, High Holborn, W.C. 1, and Carlisle, Liverpool, and Cardiff.

The International Labour Office of the League of Nations, Geneva.
M. EPITAUX, Architect. (*See also p.* 683.)

Subsidies to Builders.

Mr. A. J. Bennett, M.P., has received a letter from Sir William Joynson Hicks, the Minister for Health, on the attitude department with respect to the grant subsidy to those builders who comm operations prior to the passing of th "In my letter of October 8," says the M "I think I went as far as I can to meet t of those builders who, although the commenced building on the faith of an ass from the local authority that they would assistance, were not strictly entitled to s because the local authority did not prior approval to their scheme of assis I do not think it possible to lay down terms what constitutes an assurance local authority, though I am clear that it be something more than the mere or approval of the plans under the by-laws. ther, I must be satisfied that the builde ceeded on the faith of the assurance giv him and could not have done so but fo assurance. I am prepared to have full sideration given to any cases on their m and I would suggest, if you have any s cases of difficulty in mind, that the local a ity concerned should send full particul the department for consideration. It course, possible, though very unlikely, t local authority's scheme for giving assi under the Act may relate to only one hou

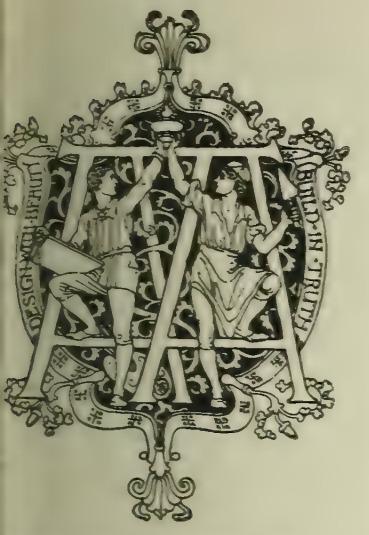
The £371 House.

The following tenders submitted fo erection of houses by the Braintree Council, were accepted, the figure in eac being per house:—Great Coggeshall: M Birkin, Coggeshall, £386 10s. Little Cogge Messrs. Belsham & Son, Kelvedon, £3 Rivenhall: Mr. P. C. Sayer, Great To £371 10s. Terling: Mr. B. Wenden, Wi £395.

City of London and Housing.

Mr. W. H. Savery, Chairman of the S Housing Committee of the Corporation, s ing on Tuesday at the Guildhall, alluded t failure of the Addison Housing Act. H that the City had handled £3,000,000 o account, and would be fortunate if it g with a loss of £2,000,000. With the new ing Act he said he thought his Committee have little to do. He had been throu carefully, and so far as he could see th ceedings under the Act were such that who decided to build might get his s through in time for his grandchildren to the house.

Northern Polytechnic Institute, Hollov



Mr. H. St. John Harrison, A.R.I.B.A been appointed to the staff of the Ev School of Architectural Design at the No Polytechnic. It will be remembered tha Harrison won the Victory Scholarship in and the Pugin Studentship of the R.I.B 1920. Previous to these he obtain Travelling Studentship in 1913, the Travelling Studentship (Newcastle) in and the British Institution Scholarship in

British Empire Exhibition, 1924.

At the request of the authorities of the E Empire Exhibition, the Royal Institu British Architects have undertaken, wit assistance of the Architecture Club, to ar an exhibition of modern architecture at bley. The exhibition will be open from 19 to June 28, 1924, and will consist of p graphs and models of buildings erected recent years from the designs of living arch Space has been allotted to the Dominion Dependencies overseas. A joint comm of organisation under the chairmansh Mr. Maurice Webb, F.R.I.B.A., is alrea work.

he kingdom ruled by the great house of
t.

the Grecian civilisation little work of note
ved. Here and there a fine statue had been dug up, the most celebrated being the Venus of Arles, found there in 1651 and now in the Louvre. In the museum at Avignon there was a headless figure of pentelicon marble, Greek sculpture of the best period, the draperies reminiscent of the work of Phidias. A few fine terra-cotta vases, sculptured slabs from tombs, and inscription tablets practically completed the list. However, the tradition and the race carried on, and even to-day the women of Arles were noted for their Grecian type of beauty.

The Romans had left a very different mark of their sojourn. It would be difficult outside Italy to find a country richer in remains of their works. That stupendous aqueduct, the Pont du Gard, which carried the water supply of Nimes across the gorge of the Tarn, was probably the finest in Europe; the two amphitheatres at Arles and Nimes were among the few that were still in use for their original purpose, the slaughter of wild beasts for the amusement of the populace. There were two almost perfect examples of temples at Nimes and Vienne, and enough remained of the theatre of Arles to enable the spectator to form an idea not only of the plan and general arrangement of the building but of its luxurious decorations.

At Arles the cemetery (*les Alys camps*) had yielded many fine sculptured memorial slabs. The best of these had gone to the Louvre, others had been placed for protection in the local museum, where there was a fine collection of carved and sculptured fragments from Roman buildings. The remaining tombs had been effectively placed in two lines between the trees in a beautiful poplar avenue leading to the ruined Romanesque church of St. Honorat.

Rich as the country was in Roman antiques it was richer still in Romanesque and mediæval work, ecclesiastical and secular. Of the former, the cathedral church of St. Trophime would probably be counted the gem, whether for its wonderful sculptured porch and cloister, or for its extraordinary simple and severe vaulted interior. Not only was there no carving, but not even a column or moulding of any kind to break the severity of the square recessed piers as they rose from the floor, and the arches of the arcade were similarly treated. At St. Gilles, across the river, the triple porchway was even finer. Built at the beginning of the thirteenth century, it was the prototype of those magnificent cathedral portals which were one of the chief glories of French Gothic architecture. In the work at St. Gilles it was evident that the builders—like Alfred Stevens—"knew of but one art," and the sculptures, while kept in perfect subordination to the architectural composition, were in themselves exceedingly fine, whether seen as interesting masses and forms contrasting with the columns and arches and patterning the spaces and mouldings, or closely examined for all their beauty of detail. Either the architect was also a sculptor or the two artists had that perfect sympathy with each other's work which was so rare, but which, when it occurred, produced those gems of architecture which were "a joy for ever."

The cathedral at Avignon was a good type of the local Romanesque work, with its low-pitched stone roof, tower with stone bell lantern, simple open porchway, and barrel vaulted interior.

Had the excursion been in search of a centre in which to study French Gothic, it was certain that Avignon would not have been chosen, and yet the city presented a more complete picture of a Gothic city than could be found in Northern France, with its three miles of fortifications, its ruined bridge with a chapel built on one of the piers, the great tower of Phillipe le Bel guarding the approach, and—crowning the whole—the great fortified Palace of the Popes, with the houses huddled in narrow streets beneath it. That impression was deepened when one looked across the river to Villeneuve-lez-Avignon and saw the hilltop filled by the great fortress of St. André, dominating the landscape, and looking as perfect as when it was erected.

There was little notable Gothic church work to see in Provence, most of the churches being either Romanesque or Renaissance, but the palace at Avignon helped to fill the gap, as within its impressive exterior there were two fourteenth-century vaulted halls of unusual scale, each being nearly 200 ft. long and over 60 ft. wide, the lower one vaulted in two spans with clustered centre columns and the upper in one.

Of Renaissance work there were two notable examples—the public garden at Nimes and the Cathedral of St. Theodore at Uzes, both memorable works.

Altogether, the excursion was a brilliant success, and the members who had the joy of participating in it would, he was sure, join him in a hearty vote of thanks to their Secretary Mr. Yerbury.

A hearty vote of thanks to the lecturer was proposed by Mr. W. H. Ansell and seconded by Mr. Robert Atkinson. The latter said he thought the 1923 excursion was one of the most successful the A.A. had had; the beautiful climate of the South of France, the wonderful old buildings—particularly the Roman remains—and their romantic situations were an extremely welcome change from work in London.

Mr. A. E. Willetts and Mr. Stanley Hamp also spoke, and the vote of thanks was carried with acclamation.

Avignon. From a Sketch by Mr. E. R. Jarrett.

CORRESPONDENCE.

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Confederation of the Arts.

SIR,—I would like to see the Charing Cross scheme linked up with, and supported by, the movement for the confederation of the arts, which already has the co-operation of the National Federation of Professional Workers, representing half a million people, and is represented on the Council of the International Confederation of Intellectual Workers, which, in its turn, co-operates with the League of Nations Commission for Intellectual Co-operation.

The Charing Cross scheme provides a site for a building on the south side of the river which could become an outlook tower (for research and study), a central market-place, and an office building on a scale similar to the L.C.C. building.

We have outgrown our galleries, and the art societies are all badly housed or not housed at all. The R.A., even, has outgrown Burlington House. There are in the United Kingdom over 400 art societies who would welcome such a scheme, which (although independently conceived) is really now seen as a development of Mr. Lewis Hind's dream of a palace for all the arts, combined with Professor Geddes' outlook tower. Brussels has its world palace; New York has a scheme prepared for (1) a university of all the arts, (2) an outlook tower, (3) a palace of the arts. Venice has its palaces for international institutions; Paris has spacious art galleries. London badly needs such a place—indeed, the Empire needs it. And why confine it even to the Empire? It should be a world centre, with congress hall, and hostel for visitors.

How to pay for such a place? It is easy.

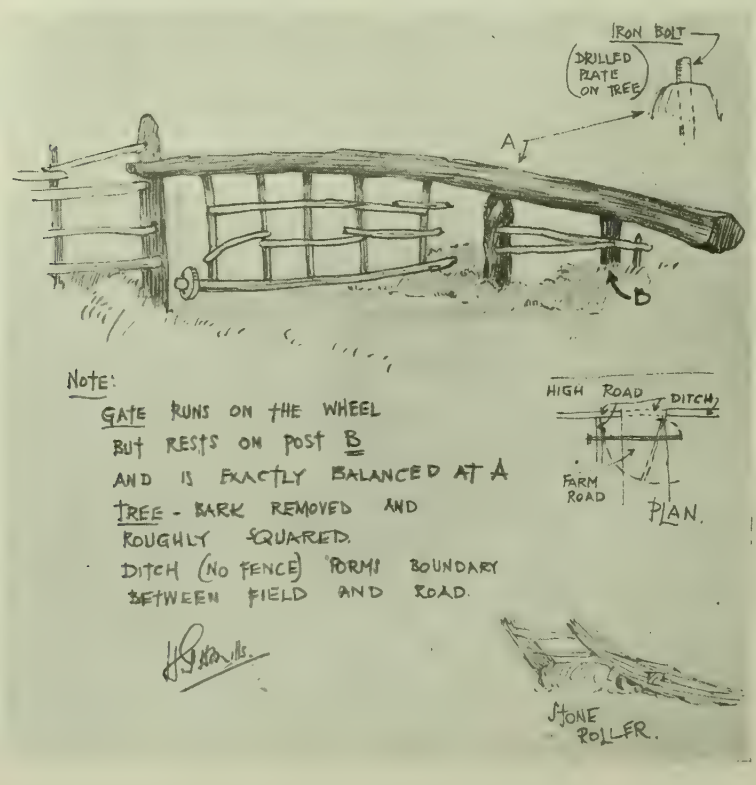
All who use the galleries and offices would pay rent, as in any other big office building. And every member of the co-ordinated societies would pay £1 a year. There are a million art workers in the United Kingdom of various kinds, and if each paid only £1 a year this would provide an income adequate to put up and to run the building. Office rents would provide additional money, and all the societies would be better housed and have better selling and exhibiting facilities than they now have. Moreover, under one roof, however divergent their individual ideas, they could work out a combined publicity scheme which would provide cheaper and much better publicity than is possible in their present scattered position. A real saving to all art societies and bodies of professional workers would ensue. *They would spend less and get more.*

Many international bodies have centres, and even headquarters in London, and the building would serve as offices for these too. It would also contain workshops for various handicrafts, who would thus be on the same spot as their market.

And I see no reason why the building should not radiate round the National Theatre and Hall for Music, Lectures, cinema experiments, &c., with restaurants and dancing. The Empire which can spend 10 millions on an exhibition at Wembley can surely pay for a permanent exhibition centre and international meeting-place at Charing Cross, as I have outlined.

I believe if the spirit to build such a place in connection with the Charing Cross scheme is aroused that it could not only be paid for, but actually be made to pay. It is no idle dream, but a business proposition.

AMELIA DEFRIES.



Royal Institution,
Albemarle-street, W.

Field Gates.

SIR,—The enclosed sketch, which I made in France, may be of interest to you or to your correspondent, Mr. A. E. Reveirs-Hopkins, whose letter appears in your issue of the 19th ult. You will observe that in this case an iron dowel is let into the gate-post, the tree being slotted and provided with an easy-fitting drilled plate.

An interesting detail is the wooden wheel on which the gate moves easily and rests when open, and the post which takes the weight of the gate when closed, the balance being so nicely adjusted that very slight effort is required to lift before opening. My notebook contains some interesting details of unworked wood construction in cottages, roofed walls, &c.

H. GRAHAM H. MILLS.

(See letter on this page.)

Architects and Suppliers.

SIR,—A practice has grown up rec specialist firms, having information architect is busy, using the telephone business, and it has occurred to me th cannot realise they are only annoying a patron. For an architect who is only to because he is busy, to be taken aw his work by a request to speak to Mr. who then proceeds to explain that he re a specialist firm, seems to me to be the of good business procedure; and when happened in a few cases, a junior is first in to get through to the architect per and then has to find his senior, the cannot possibly lead to business with mally constituted man. I hope they w the hint. "CITY ARCHIT

Purification of Rain-water for Drinki

Messrs. F. M. Thompson & Sons, Ltd., contractors, of 14, Victoria-street, West London, S.W. 1, write: "We are desi obtaining some information on the que storage and purification of rain-wa drinking purposes. We should feel through the medium of your journal, if your readers could refer us to any publi dealing with this question."

BUILDING BY-LAWS.

he course of a paper, entitled "The
of Building by By-laws and other
of Local Regulation," read before the
ol Architectural Society, on October 23,
N. C. Shelley, M.A., B.C.L. (Barrister-
), said reformers must have some object
hich to concentrate attention, or their
would become diffuse and idle, so he
attention to three recommendations of
nmittee of 1918. First, he would put a
ion made by the Committee, after every
had given his adhesion to it: that all
should cease to operate at ten-year
ls. That was really a corollary of the
given to the Minister to revoke obstruc-
-laws; it involved, however, no action
ould be construed as derogatory to local
nent or democratic principles. As
mittee said, that might involve no more
fresh compliance with the statutory
ies; on the other hand, there would be
al tendency for changes to be made in
ection of approximating to the model
o that a national code of by-laws would
).

d, he invited attention to paragraph 39
Committee's Report, where they used
ds: ". . . if a builder does not secure
sing of his plan either he must alter it,
considers it complies with the law and
repared to alter it, he can go on with
ding, and leave the local authority to
e him or to take such other steps as are
iate on the footing that he has been
f an infraction of the law. It is true
nay apply for a *mandamus* to compel the
of his plan, or probably he may, as the
ee are advised, apply under Order XXV,
of the Supreme Court Rules for a
tory judgment or order" that the plan
with the law, but to go to the High
or such a purpose is not a practical
or the ordinary man. In most cases of
even though the builder may be
and satisfied that there is no lawful
for the rejection of his plan, he will
o comply with the local authority's
of the law, and even with their extra-
hes, rather than have the trouble and
of proceedings in the Courts, which,
ted, can, unless taken in the High
ly take place after he has incurred the
of putting up the building or so much of
l serve to raise the issue. Moreover,
authority, whilst they are required to
or disapprove within one month a plan
d to them and cannot in law dis-
effectually unless the plan contravenes
or other legal provision in force in the
are not bound to specify the reason of
approval, and do not always do so.
sometimes be that the unwarranted
of a plan is due to a genuine mistake as
the law requires, or it may be based
t the other party considers a perverse
tion of the law, or merely on the
of the authority," or on what one
alled "unwritten by-laws, existing only
nd of the surveyor."

f the Committee's recommendations
was:—"That a local authority who
plan should be required to specify in
he particular respect in which its
ut would be illegal."

re he saw of the day to day adminis-
the law of building, the more he was
of the absolute injustice of saying to a
ur plan is disapproved," or even of
Your plan is disapproved for non-
e with the law," without telling him
(Public Health Acts, by-laws, or as the
be) was contravened. It gave the
chance. The law of building was
complex; it could and should be
—he hoped before the present Parlia-
ed it would be simplified—but even
Clerk and Surveyor to the local au-
d an enormous advantage in know-

ledge of the law over the architect or builder, and even over the solicitor in private practice, and every local authority ought to make it its invariable practice to inform the architect or builder, who found his plan disapproved, what precisely was the reason.

Few things would do more to reduce complaints; few would do more to educate the building community as to the requirements of the law under which they worked—and, since the local authority must know why the plan was rejected, and could not reject it except for some reason recognised by law, the trouble involved would be negligible. Many local authorities already did it, and it would be no hardship upon any to require all to do the same. That was the second reform which they might consider.

Once get definite statements of the reasons why plans were rejected, and they had the way clear for a third reform, if Parliament saw fit to enact it, namely, the creation of machinery, less costly and inconvenient than now existed, for determining which side was right—whether the local authority or the builder had correctly interpreted the law. One suggestion made by the Departmental Committee to that end was to empower a Court of Summary Jurisdiction to make a declaratory order, on the application of either side, so that the builder should not be put in the dilemma of having to do as the local authority required, or else to go ahead and see if he was prosecuted, and, if so, to risk having his building pulled down after it had been erected.

Another suggestion to the same end was that the local authority and the builder should be able to agree upon a case for the Minister's opinion, or, rather, to empower the Minister to decide a case authoritatively if both parties so desired, for already they could and sometimes did agree to state the point at issue, and they could and did express opinions in the confidence that both sides would honourably accept the opinion so given by request. But to round that off and put the procedure on a statutory footing an amendment of the law would be required.

That was a point which might be considered also, whether such a statutory jurisdiction would be helpful to them.

In conclusion, he explained briefly the scope of the three model series, and builders' attitude towards them.

The rural series, issued first in 1901, contained elementary requirements for purposes of health. He did not suggest that areas which had got on comfortably hitherto without any kind of by-laws should have even a series of the rural scope; there were plenty of places where building was safe enough with no control of any kind. But for areas of a rural type where some control was thought essential the rural model should suffice.

At the other end of the scale was the full urban series, designed to be adequate for the largest towns and thickly-populated areas with industrial development, in which the local authority maintained a qualified staff and desired to exercise detailed control over every kind of building. Then, between the two, came the intermediate series, issued first in 1905. The chief difference from the full urban was that it had no clauses as to the walls of factories and warehouse buildings. It was meant for areas requiring something fuller than the rural type—that was, something more than health provisions merely—something as to fire prevention and stability in which, nevertheless, the local authority felt it to be a needless expense and source of trouble to investigate every detail of construction of factory and warehouse buildings. That was the model which, on the whole, was best suited to the average town or urban district. It omitted nothing really necessary, but it looked to the enlightened self-interest of the factory-owner to protect himself by employing a competent architect or engineer, so that the local authority's surveyor need not spend time upon such buildings.

Parliament itself had excluded railway buildings from the local authority's control; even in the urban model by-laws they excluded others to which the same general considerations were applicable—gas works, waterworks, and so forth, in which (even when not belonging to the local authority itself) practical experience showed that stability and protection against fire would be secured. So in the intermediate model they took that a step further, and invited the local authority to release its grip upon the structure of the walls of factory buildings of all kinds.

Local authorities had hardly grown used to the idea as yet; there was a tendency till recently for them to say, if they had an urban district, that they must have by-laws covering every kind of building in every possible respect. But to-day the tide had turned, and there were signs that local authorities in all parts of the country were, in that and other ways, willing to take a less drastic view of their duty in controlling building.

Where they could make a case in local circumstances for using to the utmost the powers Parliament had given them, it was not for them to say they should not. But wherever they were willing, by following a less exacting type of model or by dropping requirements which had proved unnecessary, to strike off further shackles from their professional activities, they would find every help from the legal profession.

In every way that the law allowed, and by amendment of the law if necessary, it was most desirable to secure that justice should not only be impartial but shall be prompt, inexpensive, and readily available. In the matters discussed that evening justice was often hard to get. That was not the fault of the courts or of the local authorities. It flowed from the procedure under which both worked, and from the nature of the problems for decision. Any amendment in the system of dealing with those problems by which the private citizen who desired to exercise indubitable rights should be able to do so without delay or incurring unnecessary cost deserved the earnest consideration of all thoughtful men.

COMPETITION NEWS

"The Builder" Cost of Building Competition.

The assessor in Part II of this competition, Mr. Henry Vale, F.S.I., has made his award, as follows:—

First Premium, Type "A" Houses (£75).—Mr. G. W. Roe, Wolverhampton.

First Premium, Type "B" Houses (£75).—Messrs. Shilton & Co., Ltd., Coventry.

(Further notes on this competition are given on p. 696.)

College Chambers, Cambridge.

The assessor, Mr. C. L. Gill, F.R.I.B.A. (Messrs. Richardson & Gill), in the competition for extensions to new college chambers, King's College, Cambridge, has made his award, the winning design being by Messrs. L. B. Budden and H. J. Rowse, AA.R.I.B.A., of Liverpool.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Singapore College (Jan. 1, 1924; March 30). Hull Art Gallery (Nov. 5; May 4). Dudley Memorial (Jan. 5, 1924; Sept. 14). Eastleigh and Bishopstoke Assembly Hall — *Banned by R.I.B.A.* (Dec. 3; August 24). Taunton War Memorial (Nov. 30; Oct. 5). Memorials to the Missing (Jan. 1, 1924; Aug. 3). Shops at Ashton-under-Lyne (Oct. 26). Newcastle Concert Hall (Feb. 1, 1924; Oct. 26). British Empire Exhibition Decoration (Dec. 17; Oct. 26).

CHISWICK RIVER EMBANKMENT AND PROMENADE COMPETITION.

THE exhibition of the competitive plans for this big scheme has been held during the past week in Chiswick Town Hall at Turnham Green. It was understood early in the year, from the Press reports of the Council's proceedings, that the Chiswick Surveyor had prepared plans for the laying out of this project. However, a debate ensued, when councillors given to plain speaking urged the advantage of designs being obtained from architects well known as experts in laying out estates and familiar with up-to-date town planning. This reasonable demur upset the original proposal, and a public competition, accompanied with proportionate premiums, was started. Its progress forthwith met with a setback when the Royal Institute of British Architects objected to the conditions issued by the Town Clerk. An endeavour was made by negotiating to secure amendments of the official clauses at variance with the Regulations of the Competitions Committee of the R.I.B.A.; but all these efforts were unavailing, and Members and Licentiates declined to submit designs. The occasion was of importance considering the splendid opportunity presented by the unusual beauty and spaciousness of this almost unequalled reach of the winding Thames. Its bank skirts the 185 acres of famous land historically known as "The Duke's Meadows," recently purchased by the Chiswick District Council from the Duke of Devonshire to provide sites for a housing scheme, two playing fields, and other amenities, besides preventing the threatened erection of vast gas works over the same property.

The present immediate project includes a public promenade over half a mile long, extending from the Penstock House (west of the Sewage Works) to the London & South-Western Railway bridge spanning the river at Barnes. This loop line, going to Chiswick Station at Grove Park, on its way to Waterloo, bisects the estate, and the proposed embankment and promenade are to occupy the frontage of the eastern moiety. Adjacent to the projected promenade a considerable strip of land is to be devoted to lime tree avenues and drives fit for motors, if not for trippers' charabancs bringing folk to this new pleasure resort, with its bowling greens and a whole series of tennis courts. To the rear of this park-like lay-out are several acres of building sites beyond which industrial factories will probably reach eastward. A considerable area is low-lying and swampy, often subject to floodings in storm times and spring tides. To some extent the foreshore now to be raised was partially improved some sixty years ago by depositing mud and rubbish removed during the construction of the embankment from Westminster to Blackfriars. The foreshore of the Duke's Meadows consequently varies with differing levels; therefore, to ensure a reliable embankment, the best talent available is required, and no half-and-half measures will suffice.

Three premiums were offered, and the General Purposes Committee went ahead regardless of the R.I.B.A., and thus obtained twelve sets of plans upon which they made their award. The first premium of one hundred guineas was accorded to plans marked "Ubique," by Mr. A. B. Elliott, 7, Wilton-avenue, Chiswick. The second premium of fifty guineas was given to the design designated "No. 37," the author being Mr. G. T. Morris; and the third of 25 guineas, to a scheme marked "C. E. A.," sent in by Mr. J. W. Powell.

The estimated cost ranges from £19,000 to £25,000, but preliminary calculations for such problematical undertakings can only be approximate, with allowances for contingencies.

We take no exception as to the choice thus arrived at from these three schemes, not one of which reaches the standard demanded. This opinion is seemingly shared by the promoters, because we saw the following semi-official remark in Friday's issue of the *Chiswick Times*: "We understand that the Council will not necessarily adopt the winning design only, but that the best points of several may be taken and woven into a satisfactory whole." It is not stated who the adapter or "weaver" is to be. Such a task must be an undesirable enterprise, and in any event we beg leave to suggest that it is not the way that capable architects undertake important public work, neither can it be the best method of obtaining real values at the expense of long-suffering ratepayers. Herein consist the chief reasons for a protest.

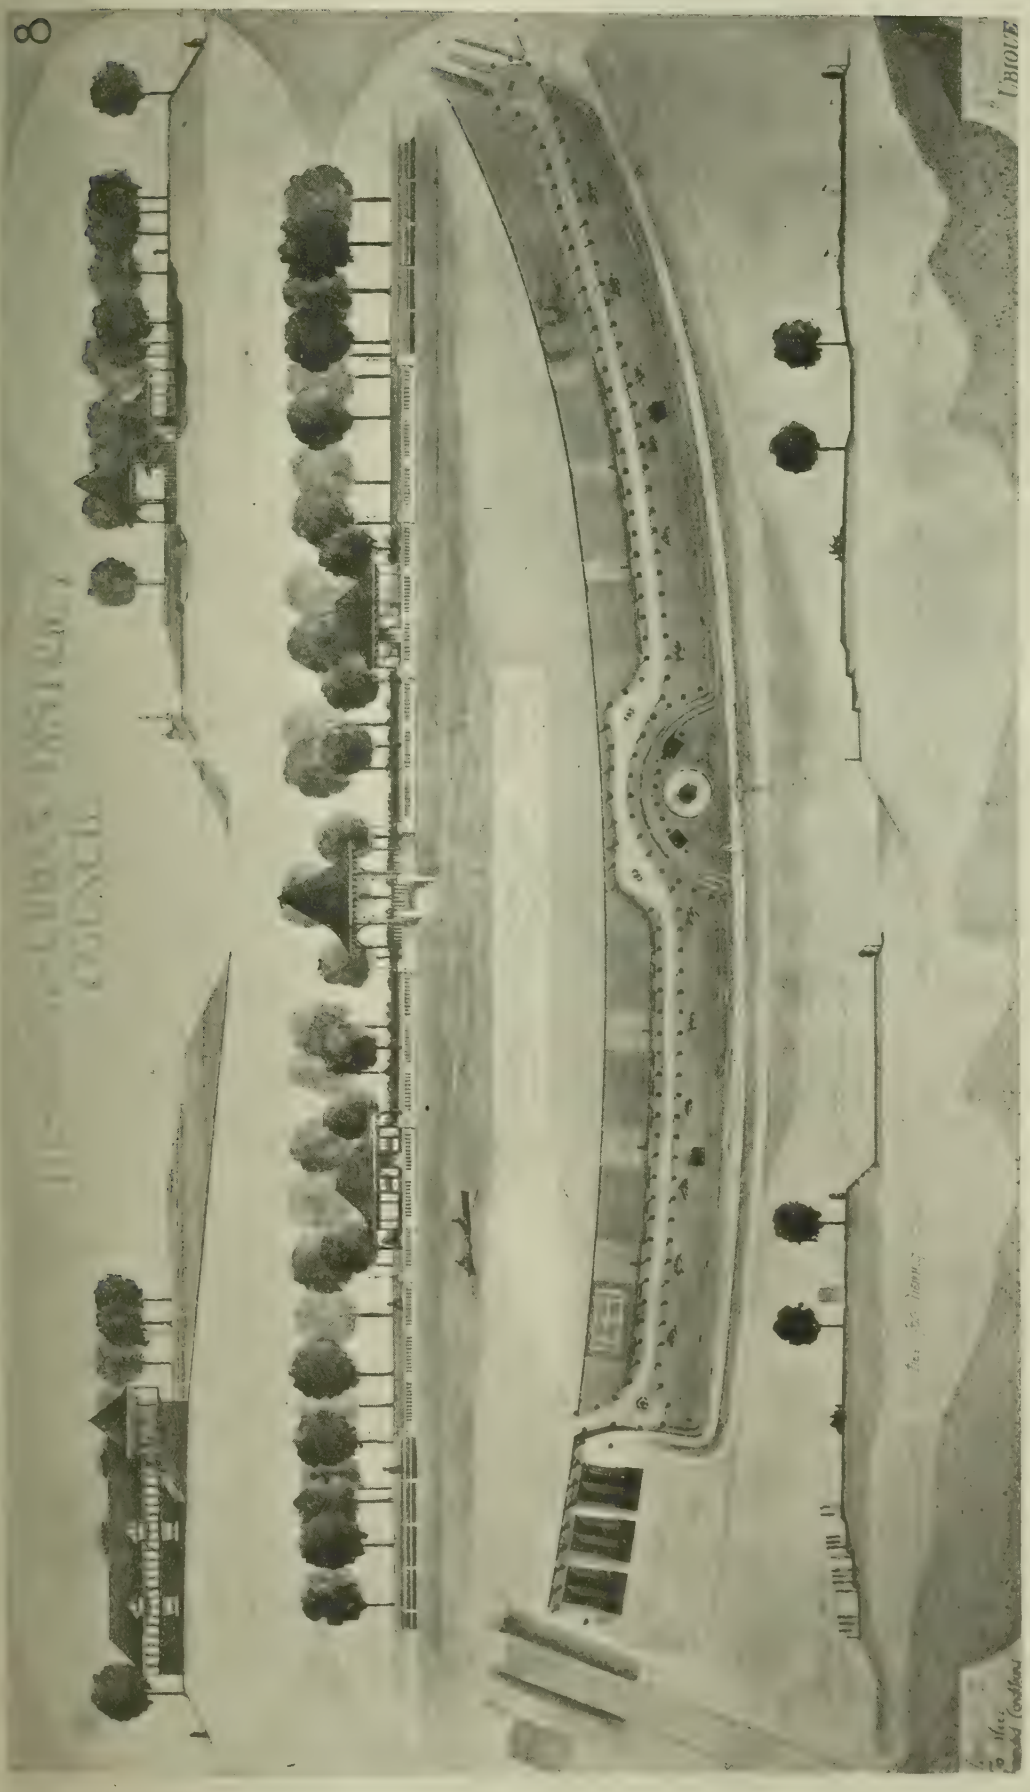
The accompanying reproduction of the first premiated plan shows the segmental curve of this foreshore site. The carriage drive, with its lime avenue, is to be approached seemingly from the west, under the railway, close to which the new boathouses are to be built. The road is well elevated, and at the eastern extremity has a roundabout turning place. The situation would be pleasant at the top of the grass-sloped bank varying in contour in conformity with differing levels. At the base, using the word in a general sense, a paved promenade faced with iron posts and rails (presumably fixed to a substantial river wall) stretches for over half-a-mile with a river approach in the centre, facing the bandstand, intended for landing visitors brought by small craft, though no proper landing-stage is provided. This stone-built stairway, set out in two flights, extends to the low water level to accommodate the tide. No lamps appear in the drawings. The conical-roofed bandstand gives an indication of the design. The irregular turfed dancing space adjacent is quite inadequate, being ill adapted to that exercise. The sward is contrived regardless of the encircling pathways, and the pair of diagonally set shelters cut up this little rendezvous. Two more shelters occur right and left, some distance away, and another stand where the motors turn to the rightabout. Surely police on point duty will be needed. The grass-covered terraces, rising with slight steps formed in the turf, are arranged one behind the other to allow spectators standing quietly in rows to see over the heads of those in front. This is the acclaimed merit of this scheme, giving such a splendid space to accommodate more than 20,000 persons to see the Boat Race when Lent comes round. Little imagination, however, is needed to realise what must happen every spring (to these neatly contrived little variations in the lawn levels) after the stampede of struggling sightseers is over, and the Boat Race day is past. The iron rails and posts will serve doubtless for many to cling to, and the dwarf ragstone walls introduced by Mr. Elliott at the edges of the sunk tennis courts and roads will furnish a long line of advantage to stand on, and specially the wooden slab seats placed at intervals to cap these walls, and intended for weary pedestrians to sit and view the games in progress. It may, however, be appropriate to remark that the ragstone wall already carried out in part by the Chiswick Works Department at Strand-on-the-Green (in spite of the combined protests of the Royal Academy, the R.I.B.A., and Society for the Protection of Ancient Buildings last spring) is identical with those here adopted for this strand on the Duke's Meadows. Where the present refuse heap stands the author intends to provide a putting green, and hard by the loop line to Barnes Bridge he has shown three double boat-houses, with a proper slipway down to the river edge. The public convenience and chalet included in the first set of conditions have been omitted in the programme.

The second premiated scheme, "Mr. G. T. Morris, consists of wavy tions of curves meandering endless wider roads in places to allow motors The lawns are segmental in shape mingled with shrubs and paths. The vous in the midst has a tall bandvironed with lawns oddly elliptical, shapes for dancing. Two sets of tennis courts, accompanied in each a hardcore court, are well arranged are two bowling greens near the House. Small dwarf hedges divide from the promenade. After the Boat Race day depart one can co how the countless little plots of grass with acute angles must be trodden recognition, to say nothing about th and bulbs, if any. The rows of trees of the embankment, in both these schemes, would be much in request enthusiasts climbing up for a good the race. Boathouses are similarly by Mr. Morris as in Mr. Elliott's pla

"C. E. A.," by Mr. J. W. Pow the third premium. He has provided for joy rides, the plan being parcelled a patchwork of paths traversing the all directions. An extensive pergola opportunities for endless fun by clim the columns and piers to see the Ox Cambridge crews. "The Retreat," l the centre piece, is, we presume, a ba There are no tennis courts nor gam but ample shelters and retiring spa distinctive provision, quite appropri water-logged site, consists of lagoons ing toy boats. This design is shown tively by eight sheets of drawings s a very diligent manner. The lago perhaps, is the one point to "be t woven into a satisfactory whole."

The remaining nine proposals are less lacking in interest, and all are an in treatment. There is not a distinc worthy of execution to be found an whole dozen.

Explaining the Housing Act.



In order to make the public famil the provisions of the new Housing Penybont Council is holding a series meetings in its area, at which the officials and members explain the A

The Chemistry Section at the British Exhibition.

A sum of £100,000 is to be spent chemical section of the British Empi bition, at Wembley, next year. It is t 40,000 square feet in the Palace of I and it will be built in such a way as a self-contained hall within the Palac intended to present to the public a picture of the present state of the Chemical Industry. No important firm industry will be unrepresented, ar exhibits will number over a hundr

London Survey Committee.

The annual joint publication of the County Council and the London Surv mittee for 1923, which will be issued weeks, should prove one of the most in volumes of the Survey of London. It c the first volume of the Parish of St Bishopsgate, and has been compiled Alfred W. Clapham, F.S.A., and Miss M. A full description of the church of St. H its monuments, with detailed drawi photographs of the details of value, fo historical account of the Nunnery of S and the parish church. Certainly no bu the city exceeds this in interest, and vantage has been taken of the recent di during building operations in St. Hele to bring the account up to date. Th publications are issued gratis to subsc the Committee (address: 27, Abingdo Westminster, S.W. 1), and a limited are on sale at £2 2s. to the public.

Design for Riverside Promenade at Chiswick.

First Premiated Design. By Mr. A. B. Elliott. (*See p.* 680).

Dundee City Hall.

Intimation of a gift of £100,000 by the late Sir James K. Caird, Bart., for the erection of a City Hall and Council Chambers for the City of Dundee, was made on April 9, 1914.

The foundation stones were laid on July 10, 1914, by King George and Queen Mary.

The Hall and Council Chambers occupy a site a large part of which was formerly the Greenmarket, a densely populated area.

The height and weight of the buildings, the unequal nature of the site, and the nearness to sea level necessitated the use of reinforced concrete piles, and the skeleton of the building, also of reinforced concrete, is carried on these piles. There are sill beams between the heads of the piles carrying the main walls. Many of these piles rest on the walls of the old docks.

The superstructure is entirely carried on a reinforced concrete framework which supports walls, floors, staircases, balcony, gallery, organ chamber and roof, and this framework has been so arranged that throughout the whole area of the hall there are no columns to obstruct vision. Much of this structural work has been tested up to twice the load it will be required to carry, so that there is no doubt as to the strength of the building.

The main roof is supported on steel trusses of 84 ft. span, and the disposition of these trusses is reflected in the design of the ceiling and walls of the hall interior. The steel roof was erected by means of cranes on a travelling scaffold, which was wheeled from one end of the hall to the other as the erection of the roof work proceeded. An integral part of the roof is the metal ventilation duct, 10 ft. wide by 6 ft. high with outlets to openings in the ceiling. There are 40,000 rivets in the metalwork of this duct. Above the ceiling also are the winches for lowering the electroliers down to the floor level for cleaning. When in position these electroliers hang by chains as well as by a steel cable.

The ventilation and heating is on the balanced plenum system. At the inlet chamber there is a complete series of air filters and washing apparatus, and the filtered air is driven by a large fan with a 20 h.p. motor through the heating battery into the duct already mentioned, and into the hall through the ceiling openings. The foul air is extracted through openings in the steps of the balcony and gallery, and in the wall under the balcony ceiling. The side walls of the hall are hollow up to the sills of the windows, and thus a maximum area of foul air upcast shaft is gained. A ring duct under the windows collects the foul air, and it passes through the exhaust fan out to the open. The hall is thus heated by the ventilating air. The Marryat Hall, the corridors and the retiring rooms are heated by radiators. There is a bioscope room at the back of the hall. There is a kitchen above the Marryat Hall which, by means of lifts, serves both this lesser hall and the Lord Provost's room below.

The floors in the hall are wood, covered in the passages with cork carpet; the corridor floors are terrazzo with marble insets and Roman mosaic bands; the main entrance vestibule is floored with marble. The wood finishings of the hall are mahogany, darkened and dull polished. The window sashes are steel. Automatic fire detectors are installed all over the building, and there is a complete installation of fire hydrants and extincteurs.

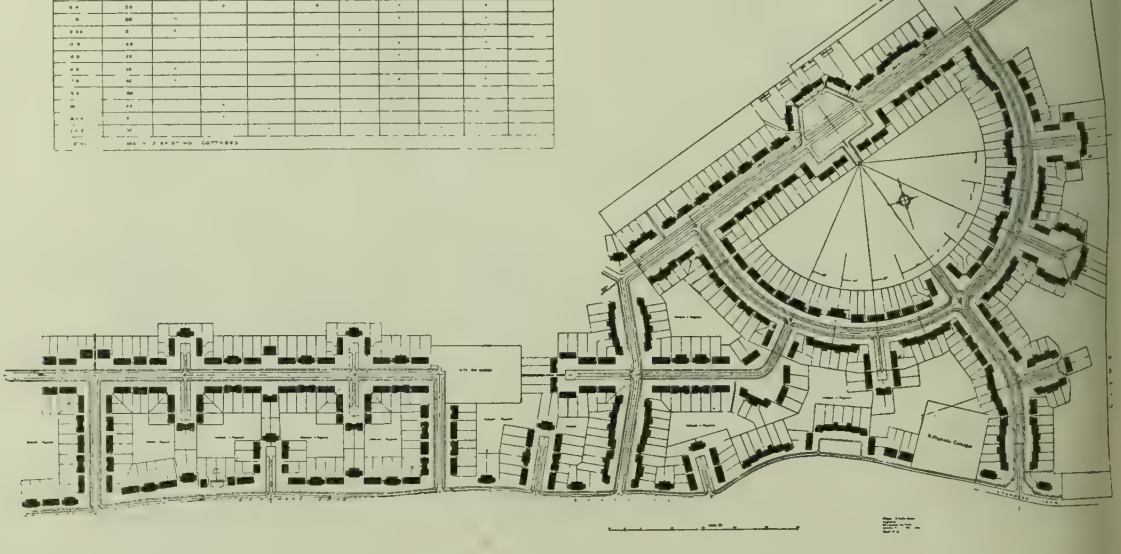
The hall occupies the entire south frontage of a future square in the heart of the city. The two wings yet to be built form the east and west sides of this square, and the north side is open to the High-street. In the future the hall will have its entrance from this square, and the colonnade will be the dominating feature of the square. Statuary groups are proposed for the large pedestals te the steps, and these groups will be on line of each of the footways of th There are ten Doric columns in the each 4 ft. diameter and 32 ft. hi square pillars terminating the colonn the background for the statuary gro doorways are plain with circled heads stone panelling, the rustication and th cast by the circular recess being i with the colonnade.

Through the three doorways in the the front is reached the main entrance a hall 60 ft. long, 24 ft. wide and 2 floored with marble and enclosing stairway.

The corridors are carried around t of the hall. At the four corners of th are staircases leading to exits, and corridor has a means of exit at b From the north corridor the wide mai the balcony are reached. Adjacent upper and lower north corridors are room suites, four in all. The corr designed with deep mahogany base, pla broken with pilasters, and the ceiling and moulded. The total area of the space is nearly a quarter of an acre.

To the hall itself there are 16 do from the lower corridors into the area a the upper corridors to the balcony an and 2 of the doorways on the lower convenient to the platform.

The dimensions of the hall are as f Length, from façade of organ to b 230 ft.; breadth, 82 ft.; height from 50 ft. The hall is seated with tip-u upholstered in grey corduroy. The 1 ft. 8 in. wide, and the rows nearly 3



Mr. James Thomson, F.R.I.B.A., Architect, was assisted by Mr. Vernon A.R.I.B.A., who had general charge of including the decoration of the hall James M'Lellan Brown, A.R.I.B.A., charge of the Council Suite and Publi by Mr. Percy Tomey, engineer for the concrete work, and by Mr. John Darg works.

The hall was opened by H.R.H. the Wales.

Winchester (Stanmore) Housing S

ation. To have conceived the scheme rried out the first part of the programme, ting to 556 houses and eight shops in its v, in face of all the difficulties such an ise involves, is creditable to the authori- Not only are the houses built, but they are f brick and roofed with tiles in keeping he city. Moreover, all the houses are d, and would-be tenants fill a long list. It is not, unfortunately, all that ilding Committee had wished and would ıd but for the economies and restrictions d by the Ministry of Health; all housing s were subject to the ruthless pruning of partment. It can only be said that it is noticeable here as in some other estates.

site acquired by the Corporation is ched from Airlie-road; it is bounded by v-road on the west, on the east by the and South Western main railway line, the south by Stanmore-lane. The land ther steeply from Romsey-road to the . A special siding was built to deliver terials by rail on to the site; the con- s for the roads and houses, Messrs. ay Bros. (London), Ltd., continued the d served the whole of the lower part of e with their own locomotive, with the assistance of jubilee rails. The upper the estate could not be reached by these and the haulage was eventually done by nd cart.

area of the site is about 110 acres, of about 53 acres have now been built iving about 10 houses to the acre. The are small, but the lay-out allows for ent allotments adjoining each group of The subsoil is chalk.

ay-out plan was designed by Mr. William luring the last year he was in practice; ises were designed by Mr. Curtis Green, F.R.I.B.A., and the work carried out is superintendence. The lay-out was not matter, for at the time the military ties were in possession of the centre of , and this area had to be preserved for Recently they have retired, and this ace is now being laid out as a recreation The roads, sewers and house drainage igned and built to the requirements of istry of Health.

ıe types of the houses sanctioned by the of Health are to be seen, ranging from ise with a parlour and four bedrooms without a parlour and only two bed- The present inclusive rents are 11s. 6d. k for a two-bedroom house, from 12s. 3d. 9d. per week for a three-bedroom vithout parlour, and from 14s. 6d. to per week for a three-bedroom house rlour. The houses are built of brick, in. hollow walls, and roofed with tiles n colour and of the quality obtainable ne to time. The houses range from the letached cottage to blocks of six.

house has a bathroom, those that are having their own hot-water supply; he bathrooms are on the ground floor water is drawn off from the copper. n is made for gas cookers and gas .

spects of the rooms and offices have all idied so that no houses of the same plan both sides of the same street. All the odation required is within the walls of se, and there are no "back elevations." ly every case a back porch is provided, h are placed the doors to the scullery, . and the fuel store, an arrangement ves the appearance of three external hields the w.c. door, forms a convenient or boot brushing under cover, and the scullery door to be left open in bad . In most of the houses the first floor and over those on the ground floor, and s be of brick instead of studding. All rs, windows, stairs and chimneys were dised.

economies insisted on from time to time Ministry of Health involved in the first e elimination of all the specially-designed t the crossing or junction of the various roads, which reduced the number of designs beyond what was desirable in a scheme of this size; all porches were omitted, and the scantlings of the joinery and the quality of the timber were reduced beyond what is generally considered good practice.

At one period the authority insisted upon the use of coke-breeze mortar; this was abandoned eventually, as it did not stand the weather.

The clerk of works was Mr. G. W. Cowrie.

BUST OF SIR JAMES CAIRD AND RECORD TABLET IN NORTH CORRIDOR FACING MAIN ENTRANCE.

Caird Memorial Hall, Dundee. Mr. J. Thomson, F.R.I.B.A., City Architect.

International Labour Office, Geneva.

This building is being erected in Geneva to house the International Labour Office of the League of Nations. The money for the building was voted at the Assembly of the League of Nations last year in view of the fact that there was no suitable building in Geneva for the office, and that it was housed in a school building some distance from the town, quite inadequate and unsuited for the purpose. The foundation-stones were laid on October 21.

A competition for plans was held among Swiss architects and judged by an international jury, which included Mr. E. P. Warren, F.R.I.B.A. and the designs illustrated are those by the successful architect, M. Epitaux, of Lausanne.

The jury made recommendations as to slight alterations in the plan, affecting somewhat the elevation towards the lake. The estimated price is equivalent to about £100,000.

A summary of the assessors' report will be given in our next issue.

MEETINGS.

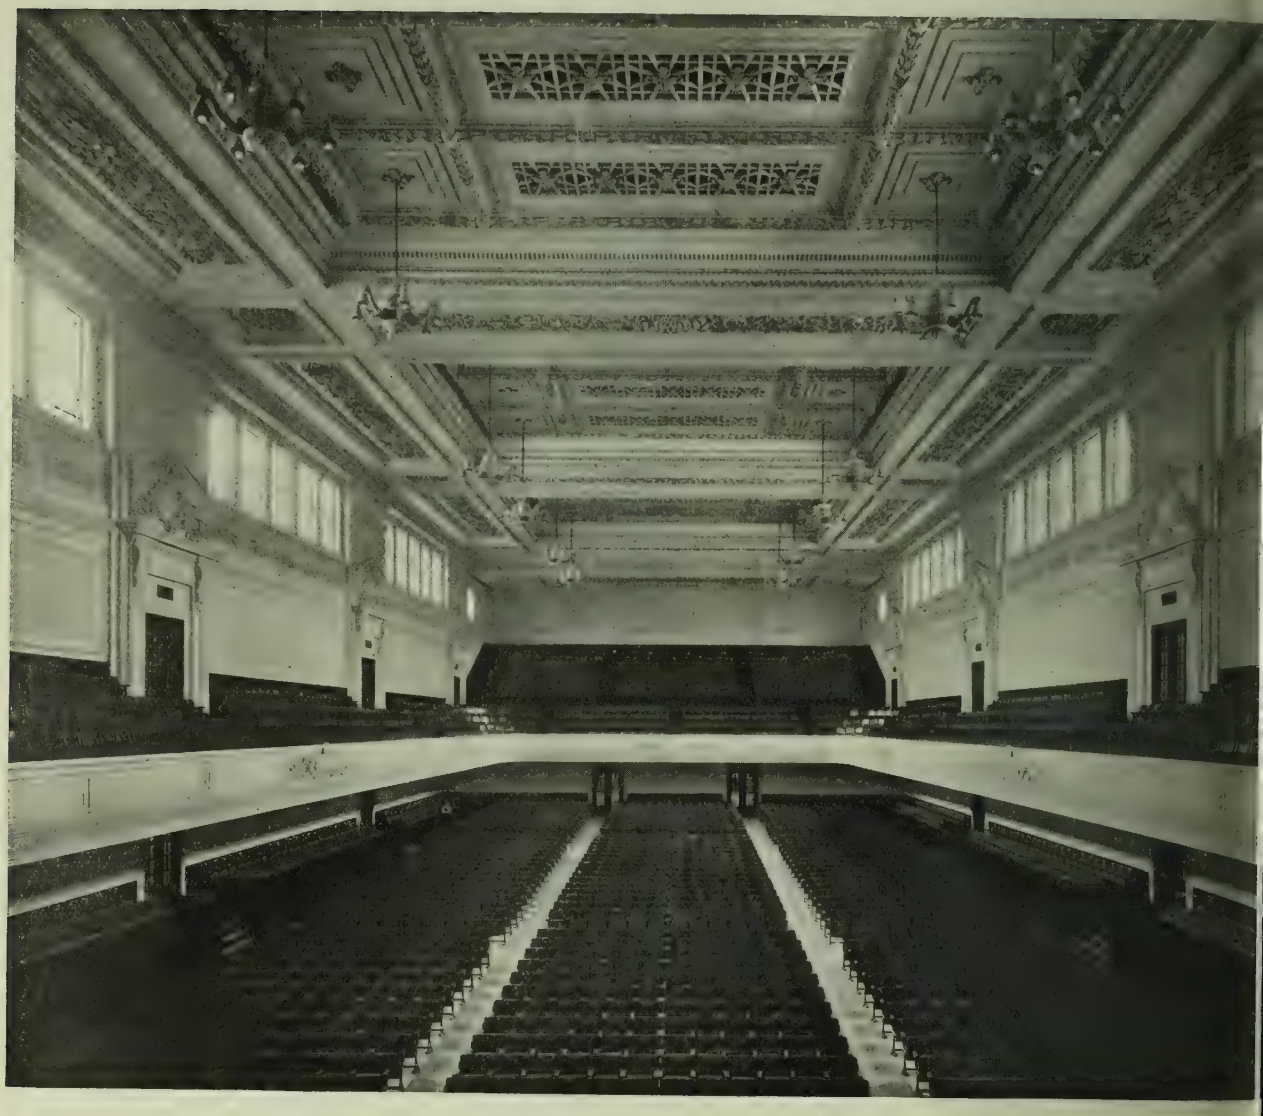
Monday, *November* 5.

Royal Institute of British Architects.—Inaugural Address by the President, Mr. J. A. Gotch. At 1, Wimpole-street, W.1. 8.30 p.m.

Wednesday, *November* 7.

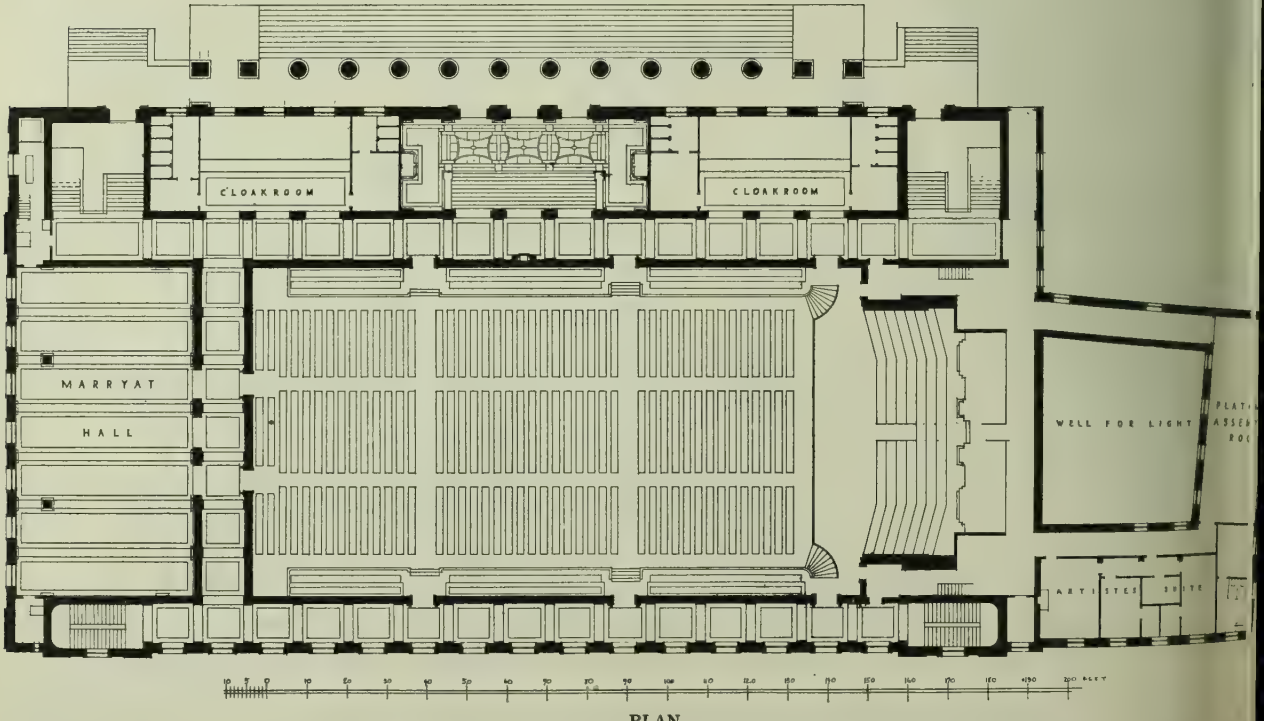
L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Greek Architecture." At Southampton-row, W.C.1. 6 p.m.

Institution of Heating and Ventilating Engineers.—Mr. F. G. Whipp on "Some Common Faults in Fan Design and Application." At Engineers' Club, Coventry-street, W.1. 7 p.m.



Royal Archæological Institute.—Mr. A. Vallance on "Criticism of Thirteenth-century Architecture." At Burlington House, Piccadilly, W. 5 p.m.

Reading Society of Architects.—Mr. Paul Waterhouse on "The Roman Point of View." At University College, Reading. 8 p.m.



Royal Society of Arts.—Lord Askwith on "Exhibition." At John-street, W.C.2. 8 p.m.

South Wales Institute of Architects.

The first of the winter season lectures, under the auspices of the South Wales Institute of Architects (Central Cardiff Branch), was delivered at the Engineers' Institute, Cardiff, by Mr. J. A. Gotch (President of the Royal Institute of British Architects), on October 18.

IE BUILDING ART: THEORIES AND DISCUSSIONS.—XI.

By W. R. LETHABY.

DIRECTION AND DEVELOPMENT.

Mediæval builders and designers were of a class very different from those whom ow accustomed to call architects. They stone, but modern buildings betray their having been conceived on flat paper and into solid material.

GOULD on "Freemasons."

t two parts grew so long that I had no link them up with the rest of this series. t out by example the fact that ancient cture" was craftsmanship by workmen. nnot go back," some may say with ce, and I quite agree; that indeed is thing I am trying all along to say in all ways, so that some may indeed see the f looking back and not only seek to emselves by the phrase "we cannot go time and to our methods will only be reached through seeking for structural perfection. No one man can do it: architecture, like any other art or science, must be a development, and the only possible base (perhaps, too, this is impossible!) is the scientific ground of experiment and demonstration. Moreover, if architects followed up their own proper business of perfect economic structure and arrangement they would have to give up the incompatible business of meddling and fussing with workmanship and would leave to workers their proper sphere. A way must be found for bringing back interested craftsmanship into the things of building once more. By leaving the arts of workmanship to the workman I do not necessarily mean that we must forsake all appearance of "ornament" until the brick-

FIG. 1.

t is absurd to "design" sham Gothic anything else out of its due time. My n is that our method of design must d with our method of production, for can we follow a theory with its expandcations in a vital line of development. ly general theory of building open to time is to aim at structural perfection cientific method, eliminating whim and and leaving the ornamental arts of ship to those who practise them.

people, I find, seem for a moment to he idea of structural perfection in and to contemplate the possibilities of e development gladly, but they will r the next minute and say, "but that merely mechanical, like a motor-car"; pressively, "architecture is more than Architecture may be *more* than that, from that, or *less* than that, and our rchitecture is greatly less than that, as ur towns, any of them, and our streets, em. Any architecture possible to our layer and the joiner can give them to us again. What I do mean is that we might save £20 or £200 or £2,000 from irritating mouldings and repulsive carvings and spend the money on real sculpture and painting by real men. It is, in fact, I that plead for more than mechanism. At present we try to disguise our failure as scientific builders by plastering on thick crusts of mechanically-made *appearances* of interesting workmanship. In reality our so-called "ornaments" are precisely the most mind-absent mechanisms of all.

When we talk about old workmanship-art it is not meant that every artist in masonry was a hod-man and mortar mixer all his life—obviously not. There are doubtless misconceptions about old building artists. Henry Yeveley evidently did an enormous amount of work; he probably "designed" more, which was carried out by others; he dealt in materials and he became quite famous, and must have been in some degree "well off." Henry Redman, King's mason, owned the George Inn at Brentford, and other house property, and his widow a few years after his death possessed a cow. Possibly he lived at Brentford and may have ridden in and out to his business in London; as early as Henry VIII he is mentioned in regard to property at Brentford.

Still, these men were masons and represented and honoured the craft of masonry. Every new apprentice in the building crafts would have been told that if he was a good boy he might come to wear "a robe of the degree of an esquire" and serve the King. The estimation in which the crafts were held and the rewards open to the craftsmen were circumstances which helped in the long, slow process of developing art. Old architecture was the thought of masons and carpenters; ours is not, and we need an idea and objective which shall correspond to *our* modern means and methods, as did theirs to those of the time. Even in the days of Wren and beyond there were fine traditions of workmanship in being, and great workmen-artists were employed. Again, the immediate contact of workers and employers induced a curious frankness, as in the carving of the portrait heads which I described. The close association and long intimacy among those of different crafts was a great factor in the development of building forms.

A point to which I wish to direct attention is the manner in which one mode of craftsmanship, when it was much admired, necessarily influenced other forms and the general development of "style." It is well-known, for example, how much painting influenced sculpture. In a similar way, the methods and forms of masonry, swiftly developed in the thirteenth century, had great influence on the carpenter's craft. Columns, arches, and stone-like mouldings were all soon adopted by skilful translation into timber work. Masonry was the first in honour and the first to advance in the cathedral and castle building epoch, and became a highly finished art while carpentry was still rude. In the fourteenth century the house-building art of the carpenter advanced so far that the forms of carpentry then strongly reacted on those of masonry. I do not think that it has been observed how much the change into what we call "Perpendicular" masonry was in a large degree caused by carrying over carpenters' customs into stoneworking. Flat four-centred arches, square-topped tracery-windows, and wall surfaces wrought into level ranges of panel-work were all natural developments in carpentry, and from thence were reflected into the technique of masonry. It was not a whim of "design" and "style"; the mason had to show that he could build houses and adapt his materials to low storys and level floors as well as the carpenter could. In the close association of those who practised developing forms of workmanship such reciprocal action and reaction was natural and inevitable. The central progressing stem of mediæval architecture was developing craftsmanship. There was steady expansion from within of the possibilities of workmanship, and all "design" was necessarily seen as workmanship.

It was only by continuously doing similar things for a long time that the full powers of craftsmanship were explored. The tracing of direction in building development may be taken up at any point throughout its long course, and, as an example, I will mention the elaboration of the window.

The traceried window not only passed through a rapid expansion from 1250 to 1450, but there were centuries of experiment before this period, during which the grouping of lights and the use of cusping were worked out. As I have before suggested, cusping of arches had its origin in the lobed edges of shells carved in Alexandrian niche-heads. It has recently occurred to me that this deep-rooted instinct to make the tympanum of an arch shell-like was no accidental whim. The hollow semi-circle filling the head of a niche was obviously of shell form, and it was called shell. In the contemporary descriptions of the building of Sta. Sophia, Constantinople, the word *conch* is used for the semi-domes of apsed recesses.

From this association of the arch-shape with "shell" came the deeply impressed instinct which led on through centuries of developing workmanship to the cusping of lights and the spreading lines of tracery.

Architecture was a development of workmanship as well in the small things as in the great. For example, let me return again to "mouldings," which have such a fatal attraction for the modern practitioner. As they grew into being, the most elaborate ones, even the too elaborate and tricky ones, were imagined through knowledge of how stone would cut—they were not foolish wriggling lines drawn on paper which an office designer orders the man with a chisel to work in solid stone. I saw the other day some elaborate thirteenth-century profiles, which by the way in which they follow the stone block show quite clearly the workmanly procedure (more or less like Fig. 2, which is from memory). Then having

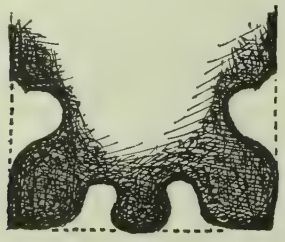

FIG. 2.

this in my mind I "ran across" an excellent marble moulding, which, although we should class it as in "the Renaissance style," had really been also found in workmanship. It conforms as closely to the chamfer plane as a Greek Doric capital which was designed by a mason in the same way (Fig. 3).

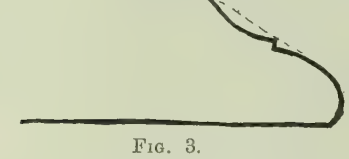

FIG. 3.

In the house where I am writing this there is a very ordinary white marble mantelpiece made about 1835, which still shows, in economy of stuff and adaptation of forms, a knowledge of workmanship. I believe it must have been the last thing *made* before architects' *designs* came between the artist and his material (Fig. 4).

FIG. 4.

Only to-day a friend in the Midlands has sent me a rough sketch of the finials from a cornrick made with ears of corn (Fig. 5). All architectural features were developed from such forms of workmanship.

Illustrations of building operations in the Middle Ages bring out the interest in the work, and the ignoring of architects' plans. In the Manuscript Gallery at the British Museum such a picture appears by accident on the page shown of Lydgate's "Metrical Life of St. Edmund, King and Martyr," written on the occasion of the visit of Henry VI to Bury St. Edmunds (Harl, 2278). The picture shows masons in white smocks and aprons, some having black caps and one a white coif. They are mixing mortar with a wooden spade, cutting stone with an axe, on a banker like a butcher's block, lifting a column by a pulley and spoked axle guided by a man on a wattled hurdle scaffold stage, another man plasters an external face with a trowel. The King with his crown on inspects the completed and rising structures (some being wood framed), closely attended by two chief workmen also in white garments, but of superior fashion and having ornamental belts. One of these, a wise-looking old person with a white beard, is evidently the head mason. There are no plans, and yet the King lifts his hands in astonished admiration. The MS. tells of the site :—

> "All the fieldis, sowyn rond a boute
> And lond arable, a full large space."

It then passes to the founding of the new town :—

> "Also beside the Wellis as I fynde
> At his coming he bilt a roil ton
> Which stant ther yet for a manier mynde
> Ffor his arryvaile, into this Region
> Which is this day, called Hundstantston."

A picture from Ely, now exhibited among the "Primitives" at the Royal Academy, shows St. Etheldreda directing the building of the first church at Ely. All the masons have white aprons, the stones are wrought with axes on blocks, one mason sets a stone with a square, another lays mortar with a trowel. Again the employer shows approval of the work, although as before there are no plans and no office, and in this case no chief master appears.

That which we, to our own great puzzlement and confusion have, since the modern vogue of Vitruvius, called "architecture," was before that time conceived as *workmanship in building*. The words architect and architecture were not known in England with our sort of meanings—or attempted meanings—until about 1600, and then meant one who professed to understand or at least to follow, the doctrines of Vitruvius, whose book was then looked on as a kind of inspired Bible. Before that time forms of the word architecture may be found in Latin writings very infrequently, but always with general meanings, as master-workman, or masterly work. Matthew Paris says that in 1224 the King's artificers made Bedford Castle of wood, *altem et architectoria arte fabricatum*—"a masterpiece of [military] art." Another chronicler (I think Higden) speaks of Rosamund's Bower at Woodstock as a wonder of architecture—a master work. In schemes of real work the art involved was masonry or carpentry, and everybody knew it; there was no profession of anything beyond useful work in good workmanship and materials. The Black Prince in ordering his tomb directed that it should be *de marbre de bone masonerie faite*. More than a hundred years before Villars de Honnecourt commended a building as "good masonry," and his book he tells us was concerned with

EXHIBITION NOTES.

THE OLD WORLD GALLERIES, LTD.

By invitation the Press visited the new premises of these Galleries, No. 449, Oxford-street, last week. The galleries are in keeping with the exhibits, and the various types of old furniture are displayed in rooms of similar character. Examples of various periods are exhibited, but the proprietors procure and make a special display of old farmhouse furniture. This type is undoubtedly more utilitarian and homely than the more ornate or specimen pieces so beloved by the collector. For the person desiring to furnish his house for use and comfort, at these galleries may be found excellent examples of refectory tables and the always popular gate-leg table, and, in addition, there are nice specimens of the Lancashire ladder and spindle back chairs. These patterns, with their wonderful rich brown colouring, are pleasant to look at and comfortable to sit on, which cannot be said of some old chairs.

The farmhouse pieces make excellent furnishings for the type of house being built by many architects to-day, and it is a satisfaction to know, while enjoying the beauty and quiet dignity of these old pieces when chosen with discretion, that one's money is well invested, for the demand for old furniture appears to be ever increasing.

A.A. HOLIDAY SKETCHES.

The standard of work at this exhibition reaches a higher level than any other of this class we remember. The majority of the sketches are put in with a precise touch and sureness which is admirable. A number of the sketches are the result of work done on the recent excursion to Avignon. The mediums used are varied, water-colour dominating, but happy results are obtained with coloured chalks, notably the impressionistic studies by Mr. Stanley Hamp, which are executed with an admirable directness; his chapel on the Pont Saint Benezet is charming, also an interior presumably at Avignon. We illustrate this week two of Mr. Hamp's sketches. Mr. Cyril Farey has several tasteful water-colours hung; "Chichester" makes a strong appeal to us with its tower showing boldly against an evening sky. Mr. Gordon Hake's "Palace of the Popes, Avignon," is treated in delicate pearly tones from across the river; the drawing, though slight, is sympathetically handled, and is very charming. An interior, entitled "Worcester," is an excellent piece of work in a low key of harmonious colour and sincere in its execution; the point of view is well chosen. Mr. St. John Harrison's studies are broadly handled, notably his water-colour of "The Porta Pinciana, Rome"; the peep through the great archway, showing the grey green cypresses, is very pleasing. Mr. John Grey's drawings of "Rye Harbour," and "The Town Hall, Rye," show this most interesting and picturesque old-world town in a quiet and reposeful manner, which is very befitting. Mr. Yerbury exhibits two fine photographic enlargements. "The Palace of the Pope, Avignon," an impressive study in sharp perspective, in which the perpendicular lines predominate; these are enhanced in value by a deep shadow in the foreground. The second study is a sunlit courtyard, with a noble plane tree, the foliage casting lace-like patternings on the adjacent building, thus making a telling picture in light and shade. Mr. H. G. Butler's "The Farm in January" is a deft piece of brush work, the leaden cloud oversailing the farm being quite impressive. Mr. W. G. Newton shows a pleasing little impression of "Sienna" in low tones. Mr. Robert Atkinson contributes several decorative colour studies, presumably prepared for his Brighton cinema. Mr. W. M. Keesey's "Camaret" is a crisp little sea study with fishing boats, and brightly-coloured figures on the quayside. Mr. Maurice B. Adams also exhibits two pleasing little works. Excellent drawings by C. J. Kennedy, P. Harland, F. P. M. Woodhouse, and many others demand attention, but space precludes. Those whose taste and interest lay in this direction would do well to visit the exhibition. They will be well repaid.

A DETAIL OF THE ORGAN.

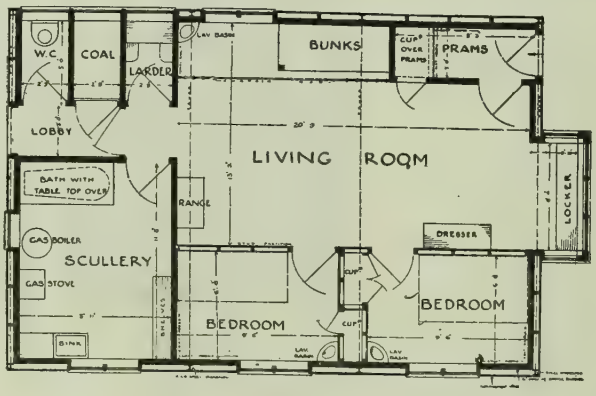
Building Schemes in Liverpool.

Alderman J. G. Paris, the chairman of the Corporation Estate Committee, in a speech which he delivered at a Conservative election meeting in St. Jude's Hall, Low-hill Ward, last week, declared that Liverpool would next year be a hive of industry. He referred to important works to be undertaken in the city. The total value of the schemes, including those of the Corporation with those originated by private enterprise, was over £3,000,000. It would be good news for the painters, he said, that the interior of St. George's Hall and the whole of the Municipal Offices were going to be repainted, and for all departments of the building trade January would inaugurate a year of unexampled activity. The Holt building, in Water-street, costing £1,000,000, would employ thousands of men, and in March would begin the Clayton-square scheme at a cost of £350,000, most of which would go in wages into the pockets of the Liverpool working men.



In addition to work by private firms, the Corporation had big building schemes ahead. The Stanley Abattoir and Cattle Market would cost £400,000; and that scheme would not only employ a great volume of labour in the construction, but would capture for Liverpool a large part of the killing and the frozen meat trade. The new tramway works at Edge-lane would cost £300,000, the Alsop Secondary School £40,000, the Art Gallery extension £30,000, the Allerton School £21,000, the Edge-lane School £21,000, and the Newhall-lane School £21,000. The Corporation work to begin in the new year represented a total of over £900,000, and adding this to the work undertaken by private enterprise it could be claimed that within three months from to-day there would start in the city schemes of a total value of £3,000,000. Further ahead lay Sir Archibald Salvidge's Mersey tunnel scheme, which, if it came off, would involve a total expenditure of £6,000,000, most of which would go in wages to the working men of the port.

The "Bristol" Bungalow.

[These bungalows, which were estimated to cost £195 each, are recommended by Councillor E. W. Savory, Chairman of the Bristol Housing Committee, as a solution of the housing problem. The "life" of these dwellings is estimated at 50 years.]

OWN PLANNING.

WILLIAM HAYWOOD, F.R.I.B.A., is series of lectures on "Town Plan- at the Birmingham University, of he first two are summarised below:—

I.—Ancient Town Planning.

planning has been practised more or ce neolithic man first abandoned m. and settled in primitive colonies abundant food, water, and the means r. These factors are essential to the a, whether primitive or modern; but or sing to find that, in the first traces tive existence in Egypt, Assyria and nd even in the pre-historic Terramare al Europe, there is usually more of a preconceived and comprehen- nning of streets and buildings than found in our industrial cities of the th century. Many early towns were as rigidly as those of modern , at a time when the deficiencies of ethod were of less importance than to-day.

indicative of the eastern origin of town arrangement in Greece, that mus, the first known professional nner, and a resident in Athens in the tury B.C., was an Ionian of Miletus, s from the Asiatic cities of the Mace- age (commencing 330 B.C.) that we first really adequate records of com- planned towns. The conquests of er led to the building of many such Asia Minor, under conditions favour- a complete and artificial design; and a marked increase in the adoption of iron type of street planning from this wards.

eresting aspect of town government is l by the building laws of this period. erfect inscription at Pergamon con- rt of a Royal law, to the effect that is structures could be taken in hand rs appointed for the purpose, and re- t the owner's expense, plus fines for The same officers controlled street and scavenging. Party walls had governing their repair and the ex- of damp. Brickmaking was regarded noxious trade, and was not permitted ty. Outside the city, widths of roads d, and adjacent owners were held re- e for road maintenance. Within the eet control was probably even more but of this we have no certain data; bly resembled that of Priene, which ered by the municipality.

the Greeks were not uniformly appre- of formal town planning, they were in a highly fastidious attitude to- eir public buildings. They liked their always in view, but not so easily e as to permit an immediate passing worldly to a spiritual environment. sanctuaries, therefore, occupy sites re as conspicuous and isolated as pos-

n temples were not built to house tions. The building itself was liter- house of a god, and the worshippers d about the altars which stood before ce the great terraces at Pergamon and precincts about Grecian temples gener- hich serve the double purpose of dating ritual, and of emphasising the ce of public ceremony in the life of munity.

II.—Roman Colonies.

contribution of Rome to progress in nning is best approached by way of nial output; which gives an easily od background to the more important fused conditions of the capital city

irst we must note the proximity to f certain fortified settlements of lake- , of which more than one hundred exist ern Italy, between the River Po and the Apennines. These settlements are known as Terramare. They date back to 1400–800 B.C.; and in their street alignment and regular disposition of sites for building they are as precise as a Roman military camp. It is possible that a knowledge of these formally planned Terramare may have been handed on to Rome by way of the intervening Etruscan cities of which we know so little; or, that the Romans themselves discovered these cities of lake-dwellers during their military excursions. But of this we have no certain knowledge.

Roman towns of complete design first appear in the period of the late Republic, approximately 200 B.C. At that time, and later, bodies of emigrants and time-expired soldiers were thrown off from the parent city and established in small fortified towns, the sites for these towns being determined by the military needs of the time. The character of their plan—naturally enough—followed military precedent. Seventy or eighty such towns were founded or refounded prior to 120 B.C. Sulla, after 81 B.C., added a dozen or so, and Augustus about thirty more. Many of the most important cities of Italy to-day originated in this manner, and still retain much of their first plan.

SKILLED LABOUR AND HOUSING.

Labour Minister on Shortage of Operatives.

SIR MONTAGUE BARLOW, M.P., Minister of Labour, received on Tuesday morning a deputation from the Birmingham City Council on the subject of the shortage of skilled building workers.

The Lord Mayor said that housing in Birmingham was held up by a shortage of bricklayers, and that, in consequence, the Council was prevented from making the progress called for in improving the present deplorable conditions. There were thousands of cases in which families were living in one room, and there was a crying need for houses which the Council were anxious to meet. They had held conferences with the employers' and workers' organisations with a view to securing an increase in the number of bricklayers, and making other arrangements necessary for expanding the volume of building, but without result.

Sir Montague Barlow said that opportunities for employment were restricted for very large numbers of workers by a shortage of certain classes of skilled building workers, especially bricklayers, and he had already thought it well to refer to this in speeches he had recently made in London and at Coventry. His statements on the subject in his speeches at Stationers' Hall on the 16th ult. and at Coventry on the 22nd ult. had been challenged, and he had been referred to the fact that 85,000 building workers were unemployed, and that, therefore, the question was not one of shortage of labour. To quote a statement which had just been issued by the Independent Labour Party, "although so many houses are required, 85,000 unemployed builders are prevented from starting on them." As he stated at Coventry, there were some 5,000 carpenters and 15,000 painters for whom no vacancies were offering, not to mention some 35,000 labourers. But all these were largely held up by the shortage amongst the bricklayers.

At a time when one of the most serious facts was the general unemployment of youth, a fact which must be keenly appreciated by all parents who wish to see their sons placed in a position to earn a livelihood, a failure in the building trade to take the quota of apprentices, even to the extent which the agreement with the trade unions would allow, was a matter which demanded most serious consideration. It was possible that neither side in the building trade was entirely free from blame in this matter, but the community were entitled to ask what steps the trade proposed to take to give young men the necessary training without delay.

A demand had been made that all building but that of houses should be stopped. This appeared to him to ignore the fact that in this country at present there was a million-and-a-quarter unemployed, and that the great necessity at the present time, a necessity to which Labour leaders constantly referred, was to provide work. He would prefer to see the number of workers increased in the building industry with proper safeguarding conditions rather than the stoppage of any form of building.

He wished to suggest to the Birmingham City Council that they should present to the employers and operatives in their area a clear and detailed statement of the building work which they wished to be carried out for many years ahead, taking into account the arrears, normal yearly requirements, and the slum clearances which were contemplated. With such a definite programme before them he would suggest that the building trade employers and operatives should further consider together the means for securing as soon as possible an increase of skilled workmen to meet the present situation and an increase in the number of apprentices.

Labour's View.

The controversy over the housing problem in Bristol still continues. In a long letter to the local papers Councillor F. E. White, Secretary of the Bristol Branch of the National Federation of Building Trade Operatives, and a member of the Housing Committee, gives the Labour side of the question.

Mr. White declares that the building trade operatives, had their policy been adopted, would have shown, by the erection of hundreds of houses, that they were keen on the abolition of the overcrowding in our midst. The Building Trades' Federation, in August, 1919, approached the Housing Committee and proposed that the Committee should proceed to erect houses, and guaranteed the supply of labour, but required to nominate their own supervisors, so that whatever amount might be saved in the cost of erection should not be placed in the pockets of a few, but for the benefit of the whole by a reduction in rent or rates. This was refused, but months after adopted, and again dropped. A Government housing scheme was then launched. In July, 1921, under pressure of vested interests, the Government called a halt. To meet the need of the million required the scheme was restricted to 176,000, and up to November 145,771 had been completed. It would not be overstating the problem to say that the need to-day is little, if any, better than it was in 1919.

Mr. White, dealing with the alleged skilled labour shortage, says that he knows a local builder who is prepared to build 200 or 300 houses for the working-class if an order is given him and a guaranteed agreed percentage on prime cost, and complete one every three weeks.

Mr. White opposes Mr. Savory's plan for chalets, holding that the scheme is unsuitable, unhealthy, not conducive to family life, expensive as compared with the life and construction of the ordinary brick house, and consequently an expense to the community which would not be warranted. He estimates that if let at 5s. per week, plus rates, there would be a yearly loss of over £18 on each house for 20 years, at the end of which period they would have to be rebuilt. He declares that, given the will, the Bristol Corporation, with the support of the citizens, could do a great deal to lessen the evil of the house shortage. By the levying of a housing rate, by the obtaining of the subsidy or Government grant, and by a scheme of building by direct labour, houses could be provided, and he maintains that it would be better to have a housing rate of, say, 6d. in the pound, to provide what is a vital necessity, than to have a 6d. Poor Law rate, with all its attendant evils.

The Independent Labour Party in a statement says: "Seven hundred and fifty thousand houses are required, and 85,000 unemployed builders are prevented from building them." Who is preventing them is not explained.

THE BUILDING TRADE.

THE EDUCATION OF BUILDING APPRENTICES.

On the invitation of a large number of building teachers in the N.W. area, a number of the members of the Manchester branch of the Institute of Builders attended a conference on the afternoon of Saturday, October 13. Apologies for absence were received from Mr. J. Smethurst, J.P. (Oldham), Mr. J. Storrs, J.P. (Stalybridge), and Mr. H. Matthews, J.P. (Manchester).

In opening the conference (which was attended by over 70 persons, including several interested in technical education), Mr. B. Mouat Jones, M.A., Principal of the Manchester College of Technology, emphasised the importance in the right development of technical education, of cordial and effective relations between the representatives of industry and the technical schools. He hoped that conference would assist greatly in improving these relations in connection with building.

Mr. E. M. Pearson (Preston), one of the conveners of the meeting, explained that the conference had been arranged in response to a wish expressed at a similar conference held in June last, which the teachers attended at the invitation of the builders, and it was hoped to carry forward to a further stage some of the suggestions then made for further co-operation between the representatives of the industry and those interested in technical education.

Mr. W. F. Anderson (Bolton), in opening a discussion on "The Training of Apprentices," referred to the satisfactory results which were obtained in earlier times when the relations between master and apprentice were much more intimate and definite. He maintained that, in spite of the effect of modern conditions, which compelled the employer to delegate much of the responsibility to his foremen and ultimately to the craftsman, the main responsibility for the character and effectiveness of the training of the apprentice rested still with the employer. The operative craftsman should, of course, be consulted as well, since his loyal and intelligent co-operation was essential. He urged that greater use should be made of part-time day classes for apprentices. Attendance for several evenings in the week carried with it grave disadvantages and meant in practice that many of those who really needed much instruction received none at all. Attendance in the daytime would not only mean that more apprentices would receive some instruction, but it would also mean that the less capable would receive more and better attention than was possible under the present system.

The ensuing discussion was mainly concerned with the instruction of the apprentice as distinct from the student of general building. Reference was made to the increasing specialisation within the industry, which among other effects had greatly increased the difficulties involved in the complete training of apprentices; at the same time the great developments which had taken place in the technical schools, owing to the introduction of properly organised courses, had undoubtedly raised the general standard of work which it was possible to attempt. These two factors (specialisation in the industry and the "course" system) had, however, created new difficulties; the "course" system had a tendency to cater mainly for the student who was prepared to take his work seriously and who could undertake to attend a pre-arranged course lasting for several years. This was not necessarily a fault, but it had the effect of reducing the provision for those students whose desire and capacity was for a limited or trade knowledge as against the wider or more general knowledge of the organised course. From the numbers now in attendance it appeared that the establishment of sound general courses in building was assured, and, this being so, an attempt should be made to set up trade courses of a much simpler character—courses which would be limited to the necessary requirements of apprentices in each of the trades.

Reference was made to the large number of separate trades in the industry, and to the fact that in some of them very few apprentices were to be found at the present time, and it was suggested that by arranging these trade courses to cover well-defined groups, such as the woodworking trades, the bricklaying and masonry trades, the plumbing trade, and the painting and decorating trade, it might be possible to conduct courses in most of the larger technical schools, courses for the last two trades mentioned above being already fairly well established.

Mr. T. Howarth, J.P. (Rochdale), said they were all agreed as to the ideals of apprenticeship, the changes in economic and other conditions did, however, make it very difficult for the employer to carry out his full obligations to the apprentice. He considered that training in apprenticeship should be a trade if not a national obligation. Employers and others who neglected their duty in this respect should be compelled to contribute to the solution of this problem in some other way. He supported the idea of trade courses and of attendance at the technical school in the day time, and he suggested that if, in some trades, the numbers were too small to justify separate classes, then the apprentices should be gathered for instruction at some centre such as Manchester.

Mr. Walter Thorpe (Manchester) mentioned the difficulty of getting apprentices to attend evening technical classes regularly in spite of the interest which the employer had in such attendance. He doubted if much could be done without some measure of compulsion, but he supported the idea of attendance in the day time, and welcomed the suggestion that trade courses might be set up; this latter arrangement might reduce the loss of students which always occurred in the early years of the courses.

Mr. H. H. Clapham (Salford) referred to the difficulty of dealing with the casual student. While they could not, of course, satisfy all the varied demands made upon them for instruction, all improvements which tended to make their courses more elastic were steps in the right direction.

On the motion of Mr. Steele (Wigan), it was agreed that a small committee of building teachers be formed to arrange for conferences on building topics from time to time in the N.W. area, and to help in the improvement of the connection between the industry and the teachers. One of the matters which might be referred to such a committee was, he said, the progress of the negotiations which had been taking place between the Institute of Builders and the teachers throughout the country concerning the preparation of students for the examinations of the Institute, which had recently been set up.

As one of the teacher-representatives dealing with this matter, Mr. F. E. Drury (Manchester) reported the progress made so far, and expressed the hope that it would result in arrangements being made that would be beneficial both to the Institute of Builders and to the building departments of technical schools throughout the country.

Mr. J. M. Macfarlane (President of the Manchester Branch of the Institute), in expressing their thanks for the entertainment which they had received from the builders that day, and for the opportunity of taking part in such an interesting and, as they believed, useful conference, said he hoped it might be found possible to set up on the lines a small committee to deal with such matters as they had discussed, so that they might expect to see definite results from their deliberations.

Mr. Frank Woods (Bolton), in supporting Mr. Macfarlane's suggestion of joint meetings between the teachers and the builders, said he regretted that so much difference to these important questions existed in the industry to-day. The establishment of a joint committee might furnish that information which had been missed in the past. It would, of course, be necessary that every section of the craftsman should also be drawn into the discussions since he was so intimately concerned.

Mr. Scholes Hague, M.Sc. (Principal of the Central Technical School, Liverpool), in proposing the thanks of the meeting to the Chairman, expressed his own pleasure at being able to be present at what seemed to be a most successful conference. He was glad that the enthusiasm so obviously existing among the members of the Manchester Branch of the Institute of Builders would be communicated to the corresponding branch in Liverpool. He believed that in the next few years one of the most important questions to be faced by technical schools generally would be the further development and improvement of instruction in building subjects. The maintenance of the industry in this forward movement was absolutely essential.

THE BUILDER COST BUILDING COMPETITION.

Mr. Henry Vale, F.S.I., who was appointed by the President of the Surveyors' Institution to act as assessor in Part II of *The Builder's* Cost Building Competition, in which builders were invited to submitted tenders for the erection of pairs of houses to the designs placed first in Part I of this competition, has now made his award as follows:—

Type "A" Houses (Premium, £75). Amount of tender, £1,197 16s. 8d.

Type "B" Houses (Premium, £75). No. 145. Amount of tender, £1,567 16s. 3d.

We have opened the envelopes and find that tender No. 47 for Type "A" houses was submitted by Mr. G. W. Roe, of Wolverhampton, and tender No. 145 for Type "B" houses by Messrs. Shilton & Co., Ltd., of Coventry.

We take this opportunity of announcing that the prize money in both Parts I and II of the competition was provided by Messrs. Rowland Drew & Clydesdale, Ltd., of Upper Thames street, E.C.

In subsequent issues we shall publish a report dealing with the competition.

Obituary.

The death has taken place at Kiddern of Mr. George Law, at the age of 86. He engaged in business as a contractor for many years, and had successfully carried out extensive schemes in various parts of the country.

The death has taken place at Rhyl of Hughie Roberts, builder and contractor, who was one of the best-known sportsmen in North Wales.

The death has taken place of Mr. J. Moreton, builder, of Codsall, near Wolverhampton.

THE INSTITUTE OF BUILDERS.

ıe invitation of the Council of the e of Builders, a conference was held y between the teachers in technical throughout the country, who were at taking a course of instruction in London ıe ægis of the Board of Education, and s of the Council of the Institute. At erence the subject of discussion was the of Examinations for admission to the e of Builders, as a result of which the g correspondence has passed between tatives of the teachers and the Insti-

e President and Council of The Institute cers.

LEMEN,—We, the teachers of building subjects in technical schools and throughout the country now assembled minster under the auspices of the Board cation, desire to place on record our tion of the efforts of the Institute of generally to raise the status of the industry, to increase the specialised hnical knowledge of future employers lers in the industry, and to encourage r appreciation of the value of technical n.

ving the conference with members of ouncil which we attended at your on, we beg to submit the following nt for your consideration :—

DING COURSES.—We wish to emphasise ortance of the provision for students of of a scheme of technical education of and varied character. Such schemes peration in a number of centres which ually being extended and could further loped if increasing support be given to k by the industry.

TUTE'S EXAMINATIONS.—We wish to the efforts of your Council to establish ng examinations for membership of the e, and we desire to emphasise our that no more effective preparation for posed examinations can be found than rganised courses of instruction referred e preceding paragraph. We, therefore, indications of your Institute's recog- f this fact, first by the circulation in of copies of the examination scheme ls throughout the country, and, secondly, ging to meet the teachers in conference. her beg to suggest that much mutual might accrue in the future from some nent whereby representative building could meet the members of your ations Board. In this connection it is nt that the teachers selected be truly ntative, and we venture to recommend ey be nominated in the first place by resentatives of the Board of Education cause of their knowledge of the work of hers, of the conditions under which the onal work is carried out, and the varia- n local practice in the industry, are ly fitted to advise the Council.

IPTION FOR QUALIFIED CANDIDATES.— not be practicable to set up special of instruction in preparation for your e's examinations in any but the largest ions. In order, therefore, to guarantee herever possible candidates have been d for the examinations by attendance able courses of organised instruction, order to enable technical colleges and to co-operate with your Institute to the possible extent, we take the liberty of ing that your Examinations Board indicate its readiness to exempt from appropriate subjects in the examinations ates who have satisfactorily completed ed organised courses. In conclusion, re to express our thanks for the way in you have met us and for providing an unity for the free discussion of educational s relating to the industry as a whole. pe similar opportunities will be provided future.

We have the honour to remain (on behalf of the teachers as per enclosed list),

(Signed)
F. E. DRURY
(College of Technology, Manchester),
H. E. MANN (University College, Southampton),
W. DOUGLAS MAY (Cardiff Technical College).

August 3, 1923.

To F. E. DRURY, ESQ.

DEAR SIR,—The Council of the Institute of Builders appreciated very much that the assistance and co-operation of the teachers of building subjects in technical colleges and schools throughout the country will be of real value, having regard to the system whereby admission to the Institute can be by examination only. The existence of organised building courses for the students must necessarily be of great value in the preparation for the Institute's Examination.

The Council of the Institute has appointed from its members an Examining Board with power to co-opt any properly qualified person outside the Institute to assist in the details involved in the examinations, as provided in the Institute's syllabus; therefore, in due course these powers must necessarily be put into operation.

The Syllabus provides that :—

"The Council may, at its discretion, accept an exemption in any subject for which the candidate may hold a degree which the Council considers as equivalent thereto, Candidates desiring to avail themselves of this must submit full details :—

"(*a*) The subjects from which exemption is desired.

"(*b*) Full particulars of degrees held which are suggested as equivalent to or covering (*a*)."

This clause has been drafted in a fairly wide sense because it was felt, certainly in the early stages, that it was unwise to endeavour to define the limits of exemptions in certain subjects. Having reference to the extent of technical knowledge called for in the building industry, the Council felt it wise to endeavour to avoid involving a student in the repetition of subjects in which it can be shown he has already become proficient.

Therefore, students may rest assured that if they detail the subjects from which exemption is desired and can show by certificate or other documentary evidence that they are proficient in those subjects, the Council, while reserving their right to judge thereon, will give the utmost consideration to applications for exemption in various subjects.

It is in this connection that the teachers of building subjects can render valuable assistance to the Examining Board. In the light of the experience that will have been gained after the first series of examinations, the Council considers that a most useful purpose will be served by conferring with selected representatives from the various technical colleges and schools.

(Signed) F. J. GAYER,
President of the Institute of Builders.

September 27, 1923.

Further correspondence has transpired which may result in an agreement, at an early stage, to accept successes in certain defined and established building courses in lieu of corresponding subjects for which provision is made in the Syllabus of Examinations.

THE TRAINING OF OPERATIVES IN THE BUILDING INDUSTRY.

MR. FRANK N. COWLIN, of Bristol, writes to us as follows:—

SIR,—I have read with much interest the article in your issue of October 19 by Mr. Bennett, in reference to the training of operatives in the building industry, and it is very satisfactory to know that this question of apprenticeship, which is of the most vital importance to the trade, is at last receiving attention.

The responsibility of maintaining a reasonable supply of craftsmen, and their training, should, undoubtedly, rest with the employers, and I fear it must be confessed that in the past they have not fulfilled their obligations in the matter. This is probably owing to the fact that when speculating building was at its height a large number of men drifted into the trade without any proper training, and, in consequence, the supply of labour (often of a very inferior character) was equal to the demand.

The altered conditions in the industry, brought about largely by the cessation of speculating building, and the results of the war, have practically cut off this supply, and in consequence the demand at the moment is greater than can be satisfied. The only solution of the difficulty is the encouragement of apprenticeship, and in this connection the co-operation of the employers' federations and the trade unions is desirable.

The apprenticeship system has always been in vogue in the West of England, and, in Bristol, a Joint Apprenticeship Committee of employers and representatives of the various trade organisations was formed some three or four years ago, and its operations have been eminently successful. A new form of indenture was agreed upon, premiums were abolished, and the Committee were made parties to the agreement, and practically responsible for the proper training of the apprentice. Under the terms of the indenture, the Committee have power in the case of bad conduct, or unsuitability on the part of the apprentice, or failure to teach the trade on the part of the employer, to cancel the indentures, and this has been done in a few cases.

The indenture also provides that the apprentice shall, between the ages of 16 and 18, and in his own time unless exempted by the Committee, attend such evening classes in connection with his trade as may be provided in the city, and approved by the Committee, and, as an inducement to him to continue his studies, it is provided that, in the event of the apprentice having attended such classes, and having in the fourth year of his apprenticeship passed an examination to the satisfaction of the Committee, he shall be entitled to an increase of pay during the last six months of his apprenticeship, this increase at the present rates being equivalent to approximately £25.

Every apprentice appears before the Committee when his indentures are signed, and progress reports are furnished by the employers every six months; as a consequence it is found that the boys take much more interest in their work, and I think it may safely be said that never in the history of the trade have we had in Bristol a more intelligent or enthusiastic number of apprentices than at present, practically all of whom will prove themselves first-class craftsmen.

Objection is often taken by the smaller employer to the employment of apprentices, on the ground that, should trade become slack, he would not have sufficient work to keep the boys employed; in this connection I would suggest that amongst the members of any federation a system of transfer might be arranged, which should prove of mutual benefit both to the employer and the apprentice.

If employers will only realise their duty and responsibility in the matter, the problem, if it can be called a problem, is easy of solution, as there is no reason why the system which has proved so successful in Bristol should not be equally successful in every other town in the country.

TRADE UNION LAW: INSPECTION OF BOOKS.

THE Trade Union Act, 1871, in section 14 provides that the rules of a trade union shall contain provisions in respect of the several matters mentioned in the First Schedule to the Act, and the First Schedule in clause 6, amongst such matters, mentions: "The inspection of the books and names of members of the Trade Union by every person having an interest in the funds of the Trade Union."

These provisions were recently considered in the case Dodd *v.* Amalgamated Marine Workers' Union (1923, 2 Ch. 236).

According to the report the plaintiff and ten other members of the union had been dismissed from official positions in the Union but retained their membership, and at the time of these proceedings an action questioning the validity of this dismissal was still pending, having been commenced in July, 1922. In August the plaintiff and another official who had been thus dismissed applied under the above provisions of the Act to inspect the books. The rule of the Union made under the above provisions provided: "The books and accounts of the Union shall be open to the inspection of any member or person having an interest in the funds of the Union at all reasonable hours at the head office of the Union or at any place where the same are kept and it shall be the duty of the secretaries to produce them."

On this application in August the plaintiff was told that the books were at the auditors, but the names of the auditors were refused. At a subsequent interview it was stated that the books were "in a mess" and some Australian stock had run out. On September 20 the books had been returned, and the plaintiff was shown some analysis books, but was not permitted to make extracts. On September 4 the plaintiff and others had commenced an action against the Union for a declaration that the general secretaries were invalidly appointed, and on October 14 the plaintiff and his colleagues had been expelled from the Union. On December 4 the Court had held that the general secretaries had been invalidly appointed, and on December 11 the plaintiff and others had commenced an action for a declaration that their expulsion from membership was invalid, and this action had on February 23, 1923, been decided in the plaintiff's favour.

This abbreviated statement of the facts, taken from the report, is necessary in order that the position of the plaintiff as regards the application to inspect the books and the findings of the Court thereon may be appreciated. On March 5, 1923, the plaintiff having heard a rumour that the funds had fallen from £100,000 to £67,000 in the course of a year, gave the defendant Union notice that on March 7 he would attend to inspect the books with a chartered accountant who would give the defendants an undertaking not to make use of the information acquired except to communicate it to the plaintiff. The plaintiff with two other members did so attend with an accountant, but inspection was refused on account of the presence of the accountant, and the plaintiff then commenced this action that he was entitled to inspection by an accountant on the accountant giving the above declaration.

The defendants pleaded that the inspection by an accountant was (1) unnecessary, for the plaintiff was competent to inspect the books himself, and (2) that the application was not *bona fide*, being merely made in the interests of a rival union.

In the case Norey *v.* Keep (1909 1 Ch. 561) it has been held that the right to inspect is not merely personal, but in "proper case be exercised by an accountant, f knowledge was frequently necessary f effective inspection, with which object was conferred.

Therefore, the point the Court had on this application was, was this "a pro in the sense that the application was n *fide*, and that the plaintiff had groun wish to ascertain with expert advice position of the union.

The Court referring to the facts set ou the refusal of the auditors' names, the s as to the conditions of the books, an held that the plaintiff was amply justif demand he had made, that there w matters on which it was reasonable have expert assistance, and that he *bona fide*, and was acting as he belie in the best interest of the union and i as an associate or agent of a rival u

This case shows that in such cases of proof is laid upon the parties as fol onus of showing the necessity of pr advice will be upon the plaintiff, but laid it down that the onus of proving *bona fides* or that the plaintiff is acting is upon the union.

NEW BUILDINGS LONDON.

Oxford-street.—BASEMENT.—At 309, street, Messrs. Marchant, Hirst & Co., o Town, are constructing a new baseme room for Messrs. Baber's, Ltd. T fittings are being supplied by Westw Milwall; steel, by the Bridgwater Con Co. Mr. Andrew Mather is the archite work.

39, Beauchamp-place, Pont-street, Mr. Walter Nash, builder, is just co alterations here, which include an Ada front. Beauchamp-place is a rapidly business thoroughfare. The leases of the premises expire at Christmas, a condition of renewal a new shop fr certain other works are required.

THE SCOTTISH BUILDER

ILDING SCHEMES IN EDINBURGH.

Edinburgh 1,624 houses have been pro- by the Corporation, and 397 are in course ction. Another 100 houses have been o by Government subsidy, making a total 24 houses. The expenditure upon the houses provided by the Corporation nts to about one and a quarter millions g. The scheme for the encouragement vate enterprise by a subsidy has met with or no response from builders. There is mediate requirement of over 1,000 houses older parts of the town, and the duo-slab which has been adopted by the Cor- on has been well received. According to ents by Mr. Paton, the City Chamberlain, nburgh it takes at present about £15,000 out of the local rates, and £50,000 a year the Imperial Exchequer, to meet the nce between the cost of providing and ining the houses and the rents received m. The city debt is at present between nd ten millions. About two millions g are paid in rates by the people of rgh.

Corporation has approved of the con- on of the proposed new Edinburgh to w road under certain conditions for ment subsidy. This will cost about llions sterling. The houses on the duo- stem are to be built on the Lochend estate, n Edinburgh and Leith, purchased by the ation, which has space for about 3,000. Dock Commission have submitted plans don in connection with the erection of a levator, and a quay wall is to be erected t Government assistance. In the last 1922-23, of the tramways now electrified, ve million more passengers had been than in the previous year. The Streets ildings' Committee had spent over £200,000 widening and new roads, one in process pletion running to the north side of the Hills golf course. These and other schemes een of great service to the unemployed.

SGOW CATHEDRAL.

structural design of Glasgow Cathedral subject of a lecture by Professor Charles at a meeting of the Architectural ien's Society held in the Society's Room Royal Technical College, Glasgow, on 19. The President, Mr. James ay, F.S.I., occupied the chair.

lecturer said that architecture was a art which depended on the art and of building for its expression, hence fully reciate architecture it was necessary to the actual building. Applying this e to the subject of the lecture he pointed t the eastern arm of Glasgow Cathedral, ng of upper and lower Churches, was a ecause the lower church was the comple- the upper, as it contained chapels neces- the carrying out of the full ritual of the

Although it was the rule that all impor- thedrals should have the central areas of hoir and transepts vaulted in stone, yet ission of this high vault in Glasgow al was largely, if not entirely, owing to esque influence, which lingered through- country for a long period.

t 1836 it was proposed to vault the areas in stone, but had the attempt been execute high vaulting as then designed ole structure would probably have d because no arrangement had been y flying buttresses or otherwise to with- he thrust of such high vaulting. The then proceeded to discuss the super- e of the cathedral, and showed how its parts were soundly constructed, arch thrusts being counteracted longitudinally and transversely by buttresses. He then emphasised the constructional importance of transepts as affording support to the central tower and spire, the construction of which was fully detailed. He concluded by urging young craftsmen enthusiastically to study the cathedral, and said that if they did so they would not fail to reap an abundant reward.

NEW BUILDINGS IN SCOTLAND.

Buckie.—SCHOOL.—Banffshire Education Authority is considering a new school at Buckie, estimated to cost £30,000.—At the last meeting of the T.C. correspondence was read anent the site for an additional 18 houses. It was pointed out that houses should be of concrete, as stone was too expensive.

Paisley.—CLINIC.—Plans have been passed for a medical clinic in the centre of the town. The building is a gift from Mrs. Agnes Russell, Muirfield, Castlehead, and will be known as "The Russell Institute." The institute is for the benefit of mothers and children of the town, and will consist of three upper floors, basement and attic. The building will be of reinforced concrete, and fireproof.

Keith.—SHOP.—The T.C. has approved of plans submitted by Messrs. Carrie & Co., Elgin, &c., for new premises in Mid-street.

Mossgreen.—HOUSES.—A start has been made with the erection of further houses under Fife C.C. It is proposed to erect 34 houses, and the total cost is estimated at between £10,000 and £15,000.

Greenock.—TENEMENTS.—Plans have been approved for the erection of two tenements of houses at the junction of Nile-street and Ann-street, for rehousing people from the insanitary areas.

Denny.—HOUSES.—Building has begun on 12 houses on the Anderson-street estate which the T.C. is developing under the Addison scheme. When these are completed the Council intends to proceed with the erection of two-apartment houses, with scullery and bathroom.

Banff.—POLICE STATION.—The Banffshire C.C. has decided to purchase the bank and house belonging to the North of Scotland Bank at Banff for police headquarters, at a cost of £1,250.

Rothesay.—At the last meeting of the Dean of Guild Court it was stated that the value of buildings for which warrants were granted amounted to £38,340, which included the erection of a new Roman Catholic Church to cost £25,500.

Paisley. — OFFICES. — Plans submitted by Messrs. Cook & Hamilton, architects, 7, Gilmour-street, Paisley, for new offices on a site adjoining Glasgow-road, for the Renfrewshire Education Authority, have been passed.

Brechin.—COTTAGES.—The Dean of Guild Court has passed plans for two cottages in Argyll-street, for Miss M. J. Gellatly, and for the conversion of a house in St. David-street into a shop for the Misses Duncan.

Dunfermline.—'BUS GARAGE AND HOUSES.—The Dean of Guild Court has authorised the Dunfermline Tramways Co. to erect a garage at the depot in St. Leonard's-place for 12 motor-'buses.—The T.C. has been granted a warrant to build a further 20 houses at Townhill.

Ayr.—HOUSES.—The Dean of Guild Court has passed the following plans:—Four houses of the bungalow type, to be erected at Spring-vale-road by Messrs. William Paton & Sons, builders, at an estimated cost of £4,000; villa at New Shore-road, Seafield Grounds, for Mr. and Mrs. Lindsay, Wellington Chambers, to cost £1,250. The following plans have also been passed under the Corporation's subsidy scheme:—Two dwelling-houses, Craigie-road, to be erected by Messrs. W. Govan & Sons, Prestwick, for £1,500; double villa, Craigie-road, for Messrs. J. H. Toll and D. Brackenridge, Gordon-terrace, £1,400; house, Ashgrove-street, for Mr. Robert Stewart, George-street, £850.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

WORKS OF PUBLIC UTILITY.

As announced in Parliament, the Government have formulated proposals designed to provide employment in depressed industries by stimulating the acceleration of work by companies operating undertakings of a public utility character. It has accordingly been decided to extend to such companies as are prepared to commence during the coming winter works that would not otherwise be undertaken at the present time, financial assistance in respect of revenue-producing works. Applications to the Secretary, Unemployment Grants Committee, 23 Buckingham Gate, S.W.1.

The terms on which Government assistance will be granted to approved works are :—

(1) Works which would not be proceeded with at the present time apart from the pressing need for relieving unemployment are alone eligible.

(2) The works in respect of which assistance is desired must be of a public utility character, e.g., gas, water and electricity, tramways, docks, harbours and canals.

(3) The works must be of such a nature as will afford employment during the coming winter in industries at present affected by severe unemployment.

(4) The Committee will require to satisfy themselves as to the reasonableness of the tender accepted for the works. It will be a condition of all contracts that the material employed shall be of British manufacture.

(5) Assistance will be limited to a maximum of 50 per cent. of the interest on the expenditure, as and when incurred, out of capital raised, and will normally be given only for the period during which the expenditure is not reasonably remunerative.

(6) The undertaking will normally be required to submit to such limitations as to the distribution of profits, &c., during the period of assistance as may be necessary to secure in the opinion of the Committee that no undue advantage is taken of such assistance. Each case will in this respect be considered separately upon its merits.

(7) The approval of the Committee will be required for the terms on which the capital is raised.

(8) The Committee will require to be satisfied in such manner as may be mutually arranged without interfering with the company's respon, sibility for the execution of the works, that the work will be, or is being, satisfactorily carried out and in accordance with the conditions.

Presentation at a Wolverhampton Works.

An interesting ceremony took place at the works of James Gibbons, Ltd., St. John's Works, Wolverhampton, recently, when a presentation was made to Mr. Paul Gibbons, second son of Mr. F. J. J. Gibbons, on the occasion of his coming of age. Mr. A. M. Shennan (manager) mentioned that three years ago a similar presentation was made to Mr. A. B. Gibbons, elder son of the managing director of the firm when he came of age. Since then Mr. A. B. Gibbons had been welcomed into the business, which had steadily progressed, following his visit to America to study modern business methods, and a tour of Japan, China, and India. The employees roll had risen 25 per cent. in the last three years.—Mr. J. Crowe, on behalf of the employees, presented to Mr. Paul Gibbons a fitted suit case, and spoke of the very good feeling which existed between employers and employed. He mentioned that there were many employees, both in the works and on the staff, who had been with the firm for over 50 years. He made an interesting survey of the history of the firm, which could be traced back as far as 1697. Since that time Gibbons' had been lock makers, the control of the firm passing from father to son in direct succession.—Mr. Paul Gibbons thanked the employees for their very useful gift, and expressed his appreciation of their kind thought of him. Mrs. Gibbons and Miss Gibbons thanked the employees for their kind expressions. Mr. H. P. Cartwright extended to Mr. Paul Gibbons the best wishes of the staff.

RATES OF WAGES IN THE BUILDING TRA

★NO DATE.—**London, S.W.1.**—Architects and Surveyors' Assistants required for temporary engagements in the Architect's Department of the London County Council at varying rates of pay. Architect to the Council, The County Hall, Westminster Bridge, S.E.1

HOT-WATER RADIATORS & DOMESTIC SUPPLIES.

Mr. A. H. Barker, of Westminster, writes:—

SIR,—My attention has been called to your issue of September 21, in which appears an article on "Sanitary Surveys," by Mr. Arthur H. Davies. In this article the statement is made in regard to heating arrangements that "under no circumstances must hot-water radiators be connected to ordinary hot-water domestic supply. Separate heating apparatus must be provided."

This somewhat astonishing assertion makes one rub one's eyes and look up the name of the author and the name and date of the paper in which such a statement is made. It is within the knowledge of every heating engineer that there are literally scores of thousands of satisfactory installations in which hot-water radiators are connected to domestic hot-water supplies. One well-known firm of manufacturers makes a speciality of a very excellent combined apparatus for this very purpose. Sometimes the hot-water supply is secondary, but the radiators are also often connected to the same boiler on primary supply. Whether the arrangement is desirable or not depends largely on the quality of the water used. But a sweeping statement that "under no circumstances must hot-water radiators be connected to ordinary hot-water supply" goes far beyond what is justified and would mislead an ordinary reader who did not understand the matter.

There is another statement of a similar character: As regards gas, "unless it is laid on the same principle as the coal fire it has the effect of drying up the moisture of the air." The real effect of gas used in this way is the precise opposite to this: that is, it has the effect of so increasing the moisture of the air as to make it unhygienic.

We have received the following reply from Mr. Arthur H. Davis, F.S.I., F.I.San.E., the author of the article in question:—

SIR,—I gather from Mr. Barker's letter that:—

(1) He takes exception to my statement that radiators must not be connected to domestic hot-water supply, but must be served separately.

(2) A well-known firm of manufacturers specialises in a combined apparatus for supplying both radiators and the domestic hot-water supply.

May I point out that in the paragraph of my article referring to Heating I was obviously concerned with general principles only, and not with exceptional and special circumstances or specialised apparatus.

I am fully aware that most of our leading boiler-makers can supply a special form of boiler or cylinder for the purpose of combined heating and hot-water supplies, but the basic principle in the design of all of them is that the water serving the radiators is kept entirely separate, and never mixes with the water used for domestic purposes. When I laid it down as a general principle that radiators should be served separately, I was not concerned with the method used to attain this end, and should have been exceeding the intention of my article in complicating the issue by reference to exceptional circumstances requiring special treatment

With reference to heating by gas, the words "unless it is laid on the same principle as the coal fire" would read better "unless it is ventilated on the same principle as a coal fire." A properly fixed gas fire connected to a chimney flue has no more drying effect on a room than a coal fire, but it is, in fact, a ventilating agent. If a chimney flue is defective, or a gas fire is improperly fixed, hot products of combustion will escape into the room, and these will no doubt have a drying effect on the atmosphere of the room.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDARE.—Negotiations are in progress for the merging of the two Aberdare railway stations into one by additions to accommodation of the larger.

ABERDEEN.—Plans passed by T.C.: House, Queen's-road, for Major A. L. Mackinnon, per Messrs. A. Marshall Mackenzie & Son, architects; alterations, Union-terrace, for the Aberdeen Education Authority, per Mr. J. A. O. Allan, architect; alterations, Wesleyan Methodist Church, Crown-terrace, for the Trustees, per Mr. J. A. O. Allan, architect; alterations, 68, Stanley-street, for Mr. James P. Farquharson, managing director, per Mr. George Watt, architect; alterations 25A, Union-street, for Mitchell & Muil, Ltd., per Messrs. Wilson & Walker, architects; two garages, Hope-street, for Mr. James Mathieson and Mr. Joseph Johnston, per Messrs. Sutherland & George, architects; shed, Hutcheon-street, for the Aberdeen Combworks Co., Ltd., per Mr. William S. Boice, engineer; garage, 11, Albert-terrace, for Mr. Alexander Winchester, junr., per Mr. George Watt, architect.

AIRDRIE.—The Airdrie Dean of Guild Court has approved plans for the erection of a new public library in Wellwynd-street, at an estimated cost of £10,000. The Carnegie Trust, Dunfermline, has agreed to make a grant towards the cost. The plans have been prepared by Col. J. M. Arthur.

ALTRINCHAM.—The managers of the Bradbury Central School are proposing extensions to their school buildings.

AUDENSHAW.—Plans have been approved by the Licensing Justices for structural alterations to the "Queen's Arms," for Messrs. Groves & Whitnalls, Ltd., Regent-road Brewery, Salford.

BANBRIDGE.—Plans by the U.D.C. for 26 houses have been approved by the Ministry of Home Affairs.

BARROWFORD.—Plans have been approved by the D.C. for the erection of two bungalows at Fore Side, for Mr. E. Flory.

BATH.—Plans approved: Additions, Portway Cottage, Combe Park; dwelling-houses, Evelyn-terrace; bungalow, Frome-road; lock-up shop, 42, Cynthia-road; garage, 51, Walcot-street.

BEDWELLTY.—The Council has called for plans and estimates for a new road from Markham to Aberbargoed.

BELFAST.—Plans passed: Shop and house on Wandsworth-road, for Mr. W. G. Turner: architect, Mr. Robert Lynn; shop and house on Bloomfield-road, for Mr. John McGaherty: architects, Messrs. E. & J. Byrne; villa in Martinez-avenue, for Mr. E. Youell: architects, Messrs. Hobart & Heron; additions to Cathedral, for Select Vestry of St. Anne's: architect, Mr. R. M. Close; builders, Messrs. Henry Laverty & Sons; shop and house in Castlereagh-street, for Mr. Daniel McMahon: architects, Messrs. McDonnell, Lamont & McDonnell; shop and stores on Holywood-road, for Mr. Josias Graham: architect, Mr. Robert Barron; builder, Mr. James H. Barton; shop and house on Albertbridge-road, for Mr. Hugh Fitzpatrick: architects, Messrs. F. & J. McArdle; villa on Whitewell-road, for Mr. Thomas McKinney: architects, Messrs. E. & J. Byrne; villa on Bawnmore-road, for Mrs. E. Edgar: architect, Mr. J. C. Stevenson; shop and dwelling-house on Ormeau-road, for Mr. George Coutts: architect, Mr. Samuel Stevenson; alterations to premises in Little York-street, for Mr. Simon Murphy: architect, Mr. W. J. Convery; 10 semi-detached villas on Somerton-road, for Mr. Andrew Taggart: architect, Mr. Charles A. Aickin; recreation hall in Ceylon-street, for the Lawn View Recreation Club: architect, Mr. W. C. Maxwell.

BERWICK-ON-TWEED.—The L.N.E.R. Company has decided to construct a new railway station to replace the present one, which is inadequate for present-day requirements. The scheme is to be put in hand immediately.

BELLINGHAM.—The R.D.C. has passed plans for a memorial hall at Kirkwhelpington.

BILLINGE.—The R.D.C. are proposing to improve and strengthen Orrell-road, estimated to cost £2,500.

* These prices apply to new buildings only. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A sum of 11 should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

NEW INVENTION.

Fuel-saving Stove.

THE new stove illustrated on this page is the invention of Mr. J. Danin, of 71, Tressillian-road, Brockley, S.E.4.

The working principle is an adaptation of the reverberating idea, whereby the heat units from the flame as produced in the furnace portion in front are absorbed in alternating masses of heat-storing material around which masses the whole of the flame, and hot gases pass to be absorbed *en route*. Consequently, the stove itself—which can be placed outwardly into the room or built into the fireplace—becomes a heated mass, which

very slowly radiates its heat outwardly into the room.

The fuel supply—a range of gas jets—can be turned off after about one to two hours, after which the heat absorbent mass of the stove need not be relighted for ten hours, after which period, we are informed, the room still possesses about 62 deg. F., having only consumed from about 30 to 60 cu. ft. of gas. The stove possesses a door and damper, which are closed after the gas has been turned off. By building the stove into a wall separating two rooms, both rooms may be heated by the same consumption of fuel. The only flue needed is one of 5 in. diameter, which can be made of common drain-piping built up in the thickness of the wall, preferably inwardly towards the room itself, thus, so as to enable the flue to radiate any heat contained in the gases into the room itself.

Thus the cost of ordinary chimneys is saved, and the piping-flues do not interfere with the architectural scheme of the building.

TRADE NEWS.

Expanding business has made it necessary for the Contractors' Machinery Co., Ltd., to move to much larger offices, and the address of this firm is now 7, Lower Grosvenor-place, S.W.1.

A booklet has been issued by the Thames Paper Co., Ltd., of Purfleet, Essex, illustrating the possibilities of their "SX" Board for interior lining. Modern ideas in this direction are described and illustrated, and the firm invite architects and constructors to investigate the decorative possibilities of their "SX" Board.

Mr. Frederic Coleman, of Regent House, Regent-street, W.1, has received from America fifty copies of a well-illustrated book on "Building a Bungalow." It illustrates and describes twenty-five types of suburban homes designed by American architects, and contains photographs of a few interiors and half-a-dozen floor plans. Anyone applying to Mr. Coleman for a copy of this book will be supplied with one gratis until his supply is exhausted.

The business at present being carried on by Messrs. Medway's Safety Lift Co., Ltd., at Rolt-street, Deptford, S.E. 8, has been transferred to more commodious premises at Victoria Works, Maidstone. These works have been planned on up-to-date lines, and are fitted throughout with the latest types of machinery. The Company's selling organisation will be continued at 35, Surrey-street, Strand, W.C. 2.

Messrs. W. H. Willcox & Co., Ltd., of 38, Southwark-street, S.E. 1, have secured registration of a new telegraphic and cable address, as follows: Telegrams—"Enginsplys, Boroh, London"; cables—"Enginsplys, London."

Messrs. G. L. Wilson & Co., Ltd., of 309-11, High-road, Tottenham, have issued some additional pages for insertion in their catalogue, relating to the "Chelmer" surround. This is a development of the tile surround. A cast-iron arch is used in place of a bullnose tile arch, thus reducing the cost, but still retaining the appearance of an arch fire.

Messrs. H. Young & Co., Ltd., constructional engineers, of Nine Elms Ironworks, S.W. 8, have issued a handbook which should be of considerable value to those who handle or deal with steelwork. So far as we know, this is the only publication containing the new B.S.S. Sections (revised 1920) made up into compound girders and compound stanchions. Copies of the handbook, which is of handy form for the pocket, will be sent gratis on application to Messrs. Young.

Shortage of Labour in the Building Trade.

At the meeting of the London County Council on Tuesday, replying to questions by Mr. E. M. Dence, Lieut.-Colonel Cecil Levita (Chairman of the Housing Committee) said there was a shortage of skilled labour, particularly of bricklayers, at the present time. Even if the shortage could be made good forthwith there was opportunity for the immediate employment of a further number of bricklayers, and an increasing demand would require to be met in the near future to enable satisfactory progress to be made with the Council's work. The Committee were now considering what action could usefully be taken to overcome any existing shortage with a view to enabling the housing programme of the Council to be carried out as far as possible without delay from this cause.

Income Tax.

To the harassed taxpayer who finds difficulty in reconciling his assessment with the amount of tax he thinks he ought to pay, the title of Mr. Arthur Fieldhouse's work, "Income Tax Simplified," should have an irresistible appeal. This publication, (priec 1/6) now in its ninth edition, is a practical guide to the preparation of the return of assessment, and contains full instructions for obtaining repayment of tax.

TENDERS.

Communications for insertion under this be addressed to "The Editor," and must later than Tuesday evening.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXV.—No. 4214. NOVEMBER 9 1923

THE PRESIDENT'S ADDRESS.

HIS year's Presidential Address at the Royal Institute of British Architects is of peculiar interest, because everywhere we stand on the threshold of an unknown territory; in the words of Mr. Baldwin, the times "are new and strange, and extraordinarily difficult."

It has in the past been customary for the President ew the particular problems confronting the architect e detail, and it is desirable that such problems should ewed when they are cut and dried and easily stated. the present moment architecture all the world over is a sharp turn—a turn that history might have led us to as the result of a world upheaval—and the problems ting us are not so easily marshalled and reviewed as in t. Architecture finds itself intimately bound up with ns of social reform, of trade, labour, and world policy. anning, housing, slum clearance, and the future develop- our existing cities involve considerations of so complex cter that it would be impossible to deal with them at vidually in the short compass of a speech.

e circumstances no doubt induced the President to himself to the broadest principles upon which we must the architecture of the future and safeguard our existing . Our historic monuments belong as truly to the future rchitecture of to-day, and we are responsible as much protection of the one as for the creation of the other. this, the City Churches are still in imminent danger, of the Roman Villa at Chedworth is undecided, and tgift Hospital was only saved at the last moment. l, therefore, to be reminded that the beauty of an old does not consist in the romance of ivy-mantled towers ne fact that such buildings are themselves part of the of these islands.

hould, above all, be grateful to the President for his . Few will admit that they are pessimists; they say prefer to face facts and do not live in a fool's paradise; a so, to take a pessimistic view and make no construc- estions is to lower the temperature and so help to bring e very evils we anticipate. The standard of archi- s improving, the number of those who improve it is g, and the habit of good architecture is gaining ground in London, but in the provincial towns and even in test country. Problems are now attacked on their ts, and we no longer feel it necessary to imitate the ire of some bygone age. In these circumstances, is it in that we shall produce a live architecture reflecting age and its aspirations? But the appeal is here made the public than to the architect. Architecture has tudio and taken its place among the subjects that are as concerning the layman; it is important that this hould expand further, since it was the absence of this interest in the past that we must blame for the degra- architecture during the last hundred years.

nite stride forward has been made by the Institute ng a special scale of charges for the speculative builder; it is as yet too early to estimate the extent to which ntroduce the direct co-operation of the architect and e further improvement of house architecture, yet, he direct result be small or great, the recognition of its necessity is of vital significance. Other factors are hardly, if at all, less important; the ground landlord, the house agent, the commercial firm or company, and the house decorator must be induced to learn the difference between the good and the bad and not merely to rely on that kind of "architecture" which appears to appeal most to the least educated. The indictment that is frequently levelled against a certain section of the Press, with what justification we are not prepared to say, is that, instead of leading the public and attempting to influence it towards loftier ideals, or towards the truth, it rather grubs about to find what kind of stuff "goes down," and then deliberately panders to the lowest taste, because, for the time being, there is money in it. All those concerned with building, however indirectly, should see to it that they are not open to this charge, and until they realise how important architecture is, it is hopeless to expect them to take it seriously.

The President's allusion to the difference between a common place statement and a poetical expression of the same thought admirably illustrates the difference between absolute utility and the same requirement interpreted in an architectural manner, no matter how simply. The latter must appeal to something deeper even than the intellect—something corresponding to an absolute reality which can be apprehended only by what is philosophically known as "intuition." The artist himself is not necessarily fully aware of the meaning of his own creations. The tremendous drama of "Faust" and the mysticism of the Choral Symphony embody realities concerning which Goethe and Beethoven themselves could only form a dim conception. It is the glory of the arts and sciences that they should, like icebergs, remain for the most part submerged below the surface. The President points out that we are "agreeably affected by fine literature without knowing exactly why, so, with like vagueness, are we impressed with good architecture." It is, therefore, easy to agree with Mr. Gotch as to the unfortunate results arising from the ignorance of so many who attempt to build without knowing anything of the most elementary architectural principles, and we earnestly hope that his address will reach the ears of some of the culprits, and so help to check the spread of buildings whose architecture is not merely neutral but actually injurious.

The address includes no claim that architecture is the greatest of the arts, and this departure is welcome. It is easy for each artist to assert that his own art is the chief, but the President is justified in claiming that of all arts architecture reflects the spirit of the age with the most insistence. It is the only art in which the weeds are able to grow and then to remain with the wheat, and even to choke the wheat out of existence. Hence, although we may deplore the bad taste of the public in music and literature, it has not the permanent ill-effects of ignorance and consequent bad taste in architecture.

We have already noticed that this address deals in generalities rather than in an examination of the actual problems with which we are faced. The whole is, however, greater than the part, and the generalities that the President has encompassed are fundamentals. If the true scope and meaning of architecture can only be brought home to the public—and architects must be clear about them before this is possible—individual problems will solve themselves.

NOTES.

Regent-street. SIR EDWIN LUTYENS' remarks in his article in the current issue of *The World's Work* are pertinent, as might be expected, and in many ways, of course, we are in cordial accord with his main points. He says:—"The skyline in Nash's Regent-street was without jars or jags. The curve was absolute, the main cornices were continuous; a great achievement this, if you consider the gradients. That has gone. Instead, we have in Regent-street, and other parts of London, commercial buildings covered with domes, towers, weird excrescences, and flamboyantly uneven skylines. From pavements, omnibuses, and taxicabs, thousands of people look up daily at surfaces of huge and fantastic embellishment. The effect is inescapable." As to the Dome (he alludes to where the old long-removed Hanover Chapel stood, with its well-known pediments and colonnade over the pavement) on the west side of Regent-street, it is only just to remember that this incongruous structure was carried out long prior to the existence of the more comprehensive rebuilding scheme now in course of execution. The same want of forethought happened with several other Regent-street buildings, hence the present confusion which necessarily hampers what is being done. Towards the southern end of this thoroughfare there is less likelihood of such discrepancies of skyline all the façades having to comply with the scheme agreed upon by the Government with the expert advice of Sir Aston Webb, the late Ernest Newton, and Sir Reginald Blomfield. Whatever may be thought of some of the elevations in the immediate vicinity of Oxford-circus, as to the variation of the façade now in progress of Messrs. Peter Robinson's extensions along Oxford-street contiguous with the same firm's Circus façade, we can but regret that so manifest a change of facial treatment should have been possible. When viewed from the east, looking towards the bottom of Great Portland-street, this divergency of design and difference of scale is another matter, the elevations in Regent-circus being seen only in rapid perspective.

London Development and Charing Cross Bridge. THE urgent necessity for a new road bridge at Charing Cross has now been very emphatically brought before the public, and especially the governing authorities of London, by a strong appeal this week from the Royal Institute of British Architects. In that appeal it is pointed out that the Court of Common Council is not in favour of the proposed St. Paul's Bridge, and it is well known that the London County Council is strongly in favour of a Charing Cross Bridge. Here, then, is an anomalous position. A great and costly viaduct bridge is projected for the City where apparently only a minority want it, whilst the imperative need for a fine road bridge at Charing Cross has been urged by a remarkably strong force of opinion, both lay and professional. Surely there must be found a way out of such a situation. The proper development of the south side of the Thames has been the subject of much theory and many plans, but it has never been placed in the definite category of possible and urgent needs by the governing bodies. Only the other day it was publicly stated that there was no plan for developing London. In one sense that may be true, but it is a statement which suggests a curious ignorance of the many able schemes of planning which have been put forward for years past. A large area on the south bank of the Thames has been skilfully dealt with by several well-known experts, whilst there are few important parts of London which have not formed the subject of carefully considered plan improvements. The London Society has been occupied for some time in various studies of London. It might be well if it once more seriously addressed its energies to the Charing Cross improvement, and in some way made it clear that London is not so entirely without a plan as we have seen suggested.

London's Bridges. LONDON bridges are to the fore to-day. The claims of no less than three of them—the proposed bridge at St. Paul's, the Charing Cross scheme, and a new bridge at Lambeth—are now under consideration. It is to be hoped, the weight of evidence being so much against it, that the first of these will be given up, as it is not required for traffic facilities, and it obstructs the much better possibilities of a bridge at Charing Cross, which on so many accounts is to be desired. Not only is the scheme desirable in itself as a great improvement and addition to traffic facilities; it is desirable in order to find p work for a large number of une which it would provide for so The realisation of the scheme only add dignity and attractive most important London centre, also indirectly facilitate trade by much of the congestion which this area.

Chiswick Embankment Competition. WE cannot regar signs submitted competition, and the award has be as satisfactory in their characte appear to us lacking in distin appreciation of local requireme which they seem rather out Nor do we think that by adapt from each of the premiated de weaving them together the defec in them will be overcome. At time we are not prepared to adop gestion that "capable" archite not suitably, and certainly witho dignity, co-operate over such a on the contrary, we think such be, in certain circumstances, qu able and likely to be productive results. There may be added st such counsel and co-operation, advantage in furthering a mor hensive view of the requirem preserving the result from the the unaided single mind. Not combination, in the instance present competition, would effec have in mind. It appears to u chief aim should be concerned more permanent life of the local such an improvement should c and that the quiet of a certain character which attaches to should be jealously preserved pity that the R.I.B.A. should compelled to ban the compet that some accommodation has found possible. Is it too lat that this may yet be the cas adequate result may be assure

The "Mitre" Hotel, Oxford. From an old print.

The "Mitre" Hotel, Oxford. (*See p.* 717.)

ttish oits at bley.

WITH reference to what Sir Laurence Weaver describes as a "Storm in a tea cup," a remark may be allowed us ard to the protest made on behalf ottish exhibitors at the British e Exhibition at Wembley to the hat examples from Scotland should played in a separate section apart British work. We agree with Sir Burnet that it would greatly e the value and interest of the tion to have Scottish art set forth distinctive way in order to show vidual characteristics. Much must , of course, upon the accommo- available, though it appears Sir ce Weaver has said that there ample space for all the work ed to come in from Scotland. It s, therefore, after all a matter of ement, and we are inclined to think t be a gain to have the advice of oyal Scottish Academy before g upon the precise exhibits to be om North of the Tweed. This is r. Macgillivray, the King's sculptor, ed, and it is unfortunate that his tion has followed the refusal of hibition authorities to agree with onable a proposal.

Dole New prise.

WE are beginning to realise better the waste which has been involved in expending vast sums on the dole, might so much better have been the creation of new wealth had we the foresight to apply the money s for productive work. Had this e case the Charing Cross scheme ave been completed for a far less an has been paid to endow unem- nt. So long as we disregard human values and their equivalent in wealth, we shall ignore the sounder economy of paying wages, and the false economy of the dole. The loss to human values in the deterioration of life in the latter is certain, and the loss of the money thus spent no less so; whereas in carrying forward new enterprises, adding to our commercial facilities, to the convenience and beauty of our cities, we are creating new wealth all the time. We do not write in a spirit of criticism; under the abnormal conditions resulting from the war, it was in the urgency of such a crisis difficult to appreciate the demands it made on us, and we drifted into the habit of the dole, unmindful of its economic and moral unsoundness, forgetting that the right economy lay in sustaining human values in creating new wealth, not in undermining one and retarding the other.

Competitions.

WE publish this week, as promised, an abstract of the able paper by Mr. Lanchester on "Competitions," which will add some value to the present discussion on competitions, especially in regard to the adoption of the jury system. We must all be agreed that there are certain difficulties or drawbacks in any system, and that it is well we should take cognisance of where these difficulties lie before we adopt new methods.

St. Mary-le-Strand and the Bush Building.

SOME anxiety was felt lest one of the architectural gems of London—the church of St. Mary-le-Strand—would be put out of countenance by the new Bush Building. We now see that the fear was groundless and that the simple and severe treatment of the latter has provided an admirable background for the beautiful little church.

The R.I.B.A.

THE Council of the Royal Institute of British Architects calls attention to the fact that the use of the R.I.B.A. affix, or of any affix suggesting membership of the R.I.B.A. by those who are not members of that body, is illegal, and that if any cases are reported to the Council legal proceedings will be taken. We infer from this that cases have already been reported to the Institute, and we have no doubt the intimation of the action which it is proposed to take in future will be approved by members.

The Crypt: The "Mitre" Hotel, Oxford.

GENERAL NEWS.

Professional Announcement.

Mr. R. N. Stroyer, M.I.Mech.E., of 4, Westminster Palace-gardens, Westminster, S.W.1, is also practising as consulting engineer in reinforced concrete at 57, Drayton-gardens, South Kensington, S.W.10.

Building By-Laws.

In his paper on "The Control of By-Laws and other forms of Local Regulations," read before the Liverpool Architectural Society, on October 23, and reported in last week's issue, Mr. A. N. C. Shelley, M.A., B.C.L., Barrister-at-Law, was stated to have said that local authorities, in relaxing by-laws and regulations as to control of building, would find every help from the "legal profession." Mr. Shelley informs us that the sentence should conclude, "from the officers of the Ministry."

The Builders' Subsidy.

Mr. A. J. Bennett, M.P., has written to Sir William Joynson-Hicks, the Minister for Health, asking for a closer definition of the statement made by the Minister in an earlier letter that he would endeavour to consider favourably, for the purposes of a grant of housing subsidy, the cases of private builders to whom an assurance was given by the local authority that they would be entitled to it, or that their particular cases would be put forward as deserving recipients. Mr. Bennett urged that any small house conforming to the official conditions and built since the Government appeal should automatically receive the subsidy. In his reply Sir William Joynson-Hicks says that he does not think it is possible to lay down in set terms what constitutes an assurance by the local authority, though he is clear that it must be something more than the mere ordinary approval of the plans under the by-laws. Further, he must be satisfied that the builder proceeded on the faith of the assurance given to him, and could not have done so but for that assurance. It did not necessarily follow that every house which fell within the prescribed maximum size was a proper subject for a grant from public funds.

COMPETITION NEWS

Colour Scheme Competition for Vestibule.

The assessors in this competition have made the following awards:—First Premium (100 guineas): Mr. E. A. Cox, 120, Adelaide-road, N.W.3; Second Premium (50 guineas): Mr. K. Anns, 5A, Sinclair-gardens, W.14; Third Premium (25 guineas): Mr. A. W. Wall, 33, Bonnington-crescent, Sherwood, Notts; Consolation Prizes: Mr. L. E. Robinson, 3, Southampton-street, Bloomsbury, W.C.1.; Miss Violet L. Timms, 42, West-street, Croydon, Surrey; Mr. R. F. Wilson, 103, Castle Boulevard, Nottingham; Mr. E. R. Phillips, 11, Abingdon-road, Plymouth; Mr. J. Morton Sale, 121, Lower Richmond-road, Putney, S.W.15. The winning designs are on exhibition at 315-317, Oxford-street, W. An article on this competition appears on page 733.

D.I.C. House Competition.

Thirteen architects competed in this competition for an office building, to cost £42,000, in Cross-street, Manchester, for which Professor C. H. Reilly, F.R.I.B.A., was the Assessor. The winners are Messrs. J. G. Prestwich & Sons, of Leigh, near Manchester, and Messrs. G. H. Willoughby and H. S. Fairhurst were commended. The design placed first is given in this issue.

Heating and Lighting Scheme, Belfast Union.

FOR THE BOARD OF GUARDIANS.—Installation of heating and lighting plant. Premium for best scheme submitted, 100 guineas. Sending-in date, December 18, at Noon. (See advertisement this week.)

Civic Hall, Truro.

FOR THE CITY COUNCIL.—Designs version of market house into a public Premiums, 100 guineas and 50 guineas, in date, November 12. (See adve this week.)

CORRESPONDENCE.

Chiswick Competition.

Sir,—In your published report on the premiated designs in connection with the above competition, it certainly appears evident that your representative omitted to peruse the conditions relating to same; first, from his remarks as to the "standard demanded" and the "opinion seemingly shared by the promoters," and, second, his report on scheme "37" submitted by me. I would point out to you that it was part of the conditions that the Council would not necessarily adopt the winning design, and the remarks published in the *Chiswick Times* were quite in accordance with this particular clause.

As regards my own scheme, the lawns round the bandstand were not intended to be used for dancing, and had this provision been asked for a suitable enclosure would have been included accordingly.

With respect to the remarks on the departure of the Boat Race crowds, "the countless *little plots* of grass laid out with acute angles [total number of plots two, each with an area of 250 super yards] could not possibly be trodden out of recognition," as first, the main roadway (with ample pavements) is placed directly at the rear of the terraces allotted to the crowds, and second, the grass plots and lawns are arranged at entirely different levels to this roadway, clearly indicated by the sections and at level points on the plan.

I therefore submit to you that my scheme was not as you report it to be. I am not averse to criticism; on the other hand, I invite it, but in this particular competition I do think that you have omitted to study the conditions.

G. T. Morris.

London.

[**The conditions were radically at variance with the R.I.B.A. regulations, otherwise members would not have been informed that they must not submit plans, and if our correspondent's scheme carried out the instructions issued to competitors, as we must presume was the case, then the instructions were incompatible with a satisfactory scheme.—Ed.]

[Other letters are unavoidably held over.—Ed.]

New Thames Bridge.

The R.I.B.A. has sent the following letter to the London County Council:—

"In view of the proposals that have recently been revived for the construction of a St. Paul's Bridge, the Council of the Royal Institute of British Architects wishes to reiterate its considered opinion that there is a real necessity for a bridge at Charing Cross.

"My Council desires to place on record its conviction that the London County Council should direct its policy and financial commitments towards the construction of a bridge at Charing Cross, which is urgently wanted in order to relieve the traffic over Westminster and Waterloo Bridges. The construction of such a bridge would, in addition, provide several years' work for a great number of men.

"My Council also desire to enter a strong protest against any contribution from public funds by the London County Council towards the cost of the approaches to St. Paul's Bridge, which, in its opinion, and apparently in the opinion of the Corporation of the City of London, as twice expressed at recent meetings of the Court of Common Council, is not wanted. Indeed, the Council of the Royal Institute of British Architects believes its construction would involve a serious waste of public money. On the other hand, the moment seems opportune for co-operation between the Government, the London County Council and the Corporation for the purpose of building at Charing Cross a magnificent bridge which would be one of the glories of the metropolis, and assist greatly in solving the very urgent problems of traffic and unemployment."

COMPETITION FOR NEW SETS OF CHAMBERS LIBRARY, KING'S COLLEGE, CAMBRIDGE.

The drawings submitted by seven selected architects in this exceptionally interesting competition in the University of Cambridge have not been on public view, but we were allowed to inspect them privately this week in the Library of King's College. The award of the assessor (Mr. Lovat Gill) has just recently been made, as mentioned in our last issue, and the successful design is given this week.

The contest produced a series of excellent schemes, prepared by a well-selected set of seven comparatively young competitors (chosen under the age of forty-seven years), who certainly sent in designs and drawings well worthy of the occasion. We have no hesitation in fully confirming the rightness of the award, which is in favour of Messrs. Herbert J. Rowse and Lionel B. Budden, of Liverpool University. They have not exactly had "a walk over." There can be no doubt that their planning of the sets of chambers is most conveniently contrived, and, on the whole, preferable to any other proposal. Their architectural design is conceived admirably with scholarly distinction, and quite in accordance with the immediate environments of King's great lawn, as well as the scale of the adjacent historic buildings. This remark implies a high standard, appreciated with knowledge.

The two blocks of chambers are purely domestic in character, and not of the kind usually reckoned important, but their effect in this case, combined as they will be with King's College new library building as a centre-piece, makes all the difference. Their long façade will flank at right angles the famous "Fellows" building, monumentally designed by James Gibbs in his sedately dignified manner; while directly in front, on the far side of the lawn, ranges the charming picturesque façade of Clare College. The site of these proposed buildings is now occupied by the modern Gothic premises standing in front of the Provost's garden and the Bodley quad. These can be removed without any architectural loss.

The competition designs show detail plans only of the right-hand block of chambers, but the whole of the group is fully set forth by the elevational and perspective drawings. Between the library in the middle and the chamber wings are archways giving access to the Provost's garden, and at its rear end the chosen plans prettily show an open loggia and new formal arrangement of its lawns. In the centre of the right-hand new chamber block, another archway will lead to the Bodley court, with its recessed and wall-enclosed garden seat, overlooking the river Cam skirting alongside. The adjacent bridge is in a line with the frontage of these new buildings. On either side of this handsomely treated throughway are the porter's rooms, and beyond these apartments are the entrance halls and staircases to the chambers. On the ground floor at the eastern extremity is a couple of chamber sets, consisting of a keeping room and a bedroom each. These are of ample size, and the gyp rooms, reached off the hall or stair landings, are all amply lighted and have good ventilation.

At the west end and adjacent to the Bodley building the lavatory and baths are contrived very conveniently, while a separate entrance vestibule from the court gives an immediate approach in the corner formed by the Bodley wing. The first, second and third floors are repeats, with three sets of chambers in each moiety of the block, which has a commodious central landing from whence their gyps are reached and also the coal bunkers, all excellently contrived in a modern and up-to-date manner. The heating chamber in the basement is placed centrally in respect to the whole series of buildings below the lavatory part of this block.

Messrs. Rowse & Budden ingeniously realised the enormous importance of keeping the scale of their buildings in just relationship with Gibbs' elevations, and they did wisely by not adopting the suggestion in the conditions as to making their top floor assume the character of attics in the roofs. That meant keeping the mai level with the uppermost floor and so the comparative heights of the two bui a needless way, much to the detriment new façades.

The lines adopted by the winning desig a most satisfactory connection to be olished with the Bodley block at the rea is a great gain, both as to fenestration ance and the stopping of strings and Towards the lawn the two blocks of c balance well and exactly repeat, excep Bodley court throughway. The librar an excellent composition in the centre, v disengaged columns rising above the r plinth, where there is a handsome doo the middle. Three niches with statu between the columns. The cornice is higher level than in the wings, and an at dignity to the setting of the pedime drawings are in pencil, nicely finish much approve of the broad treatmen end of the east block, which will be v spicuous from the bridge approach Cam. This effect is important with extent of the Gibbs' building coming field of vision, as it must from this fin point.

Mr. W. G. Newton (whose design is ma in accordance with the reference, if no diate suggestion, in the conditions, r feature of his tall slated roofs rising handsome cornice which necessarily therefore, much lower than that of "Fellows" building. The contrast betv windows of the old and new buildings i culty and not a gain in relative sca Newton's fenestration is really more in tion with the windows of the earlier Ren design of Clare College as seen in the over King's great lawn. His proposed is more proportionate to Gibbs' style, columns over the side screens abo Newton's throughways in their adjacent may add size, but seem a trifle out of pr to his own work. The entrance hall chambers are big and the 17 ft. by 11 keeping rooms are good. Bedrooms 7 ft. 6 in. are none too large.

No. 3, by Mr. John Burford, masks hi with statuary set above the plinth b five great windows, and the scheme i guished by strong horizontal lines with cated return block at the east extremit size where effect is of moment, as above i

Mr. Naseby Adams (No. 6) sends a priate architectural scheme with hipp and parapets, but the end towards t Cam is over-featured, so suffers in sca bedrooms, 8 ft. by 9 ft., are not over l the keeping rooms are 12 ft. square.

Messrs. Holt & Rees (No. 1) ma library by a delicately-proportioned This scheme is refined and assimilates v the Bodley building.

No. 2, by Mr. Alexander Tait, ha guished appearance, and is illustrate excellently big perspective, but this vie what dwarfs the scale of Gibbs' relatively speaking, and it overst importance of Mr. Tait's pedimented pieces to his throughways, so presenti coarsely to the disadvantage of his sur details. The top floor of the chamber lit by dormers, and though the Bodley roof at the rear mitres with Mr. Tait's other parts commingle badly, as see picture of the quad front.

No. 5, by Mr. H. A. Dod, was awa second place, but unfortunately we shown his drawings. They were not other designs in the library.

The cost of the whole projected s stated by Messrs. Rowse & Budden to to come to £100,000. The £20,000 all the first block intended to be put in based on the pre-war allowance of on per foot cube. This for ashlar-faced w unreliable at present rates of wages a

THE "MITRE" HOTEL, OXFORD.

Mitre Hotel, situated in the famous
treet in the city of Oxford, is sur-
d by some of the finest architecture in
nd. Its foundation enables it to claim
on to its antiquity.

oldest portion of the building is the
now the wine cellars of the hotel,

than 300. The proprietors of these
hostels were not allowed to apply
any other purpose than the reception
lents, nor demise them without this
n, and certain special conditions were
by the University. In these "hos-
the students lived, at first by the
tion of the nobility and great men in
and State, and afterwards at their
pense, till the pious and munificent
of learning thought fit to settle for
on them certain and plentiful revenues
and to enlarge and beautify their habitations. Most of the colleges were built upon the sites of one or more of these ancient halls, and several of them contained little more than these, with some additional buildings, retaining also their former name for a long time. Four only remain still bearing their ancient title, viz., Magdalen, Edmund, St. Albans, and St. Mary's Hall.

The house in 1474 was called Dagville's Inn, this alteration in name being due to a change of proprietorship, when William Dagville, divers times Mayor of Oxford (in 1465-6-7, 1470, 1472, and 1474), married a relative who owned the inn. He was a man of astute business, for at his death he executed a will in which he directed that if his daughter Joan died without issue Dagville's Inn and the Christopher Inn (Nos. 9 and 10, Magdalen-street) should become the property of Lincoln College. Fortunately for the college (the present owners) Joan died without issue, and Dagville's Inn was named "The Mitre." Even during this period it was well known as a "famous house of entertainment." William Dagville died October 29, 1476, and in 1499 the tenements were conveyed to Lincoln College by Margaret Parker, Dagville's widow.

Next to this inn, probably the present Turl-street entry to the old stables (and near to the hotel billiard rooms), was an entry known as Bastaple's Entry, of which Wood makes mention: "Near to that Inne was Bastaple's Entry, of whose name I find in narration of some disturbers of the peace who had abused and robbed the schollers thereof, as also S. Mildreds (which adjoins this entry in Turl-street), Hampton and Pery Hall, with others in Oxon."

The building as it stands at the period of the seventeenth century claims our attention. Considerable alterations and rebuilding were contemplated and carried out, these now forming the basis of the upper portions of the present structure. The finely proportioned elevation facing the internal courtyard, with its overhanging stories and its three gables, date from the beginning of the seventeenth century; the date 1631 can now be seen carved on the bracket under the window of the east gable. The fine oak panelling, staircases, and ornamental plaster ceilings in this portion of the hotel show that it was finished in an elaborate style. The original leaded windows are now all removed, and the present late Georgian windows no doubt took their place when the plaster front was added at the end of the eighteenth century.

An interesting example of a fireplace of the seventeenth century (see p. 727) is to be seen in bedroom No. 19, which still retains the unusual feature of a moulded oak curb: the iron stove, however, is of later date.

From the beginning of the eighteenth century the hotel remained unaltered until the year 1922, when it was found necessary to carry out considerable alterations to maintain the structure and to adapt the building for modern hotel requirements, and entirely new kitchens and extension to the dining-room and service were constructed: the old kitchen was formerly situated behind the present offices. The extension of the dining-room has been carried out in similar panelling as the original dining-room facing the High-street, twentieth-century fireplaces being replaced by others in keeping with the architectural character of the period.

Fine panelling can also be seen in many of the bedrooms, Nos. 10, 11, 12, A, C, and D, the last-named room having also a good specimen fireplace of the eighteenth century. The bay windows of the late eighteenth century form an interesting feature of the drawing-rooms on the first floor, giving fine vistas up and down the High-street.

These alterations have been executed to a considerable extent, and the old features retained by the architects, Messrs. Richardson & Gill, of London.

The Panelled Room: The "Mitre" Hotel, Oxford.
MESSRS. RICHARDSON & GILL, FF.R.I.B.A., Architects. (*See p.* 717.)

On Monday last the opening general meeting of the Royal Institute of British Architects for the 1923-4 Session was held at the premises of the Royal Society of Medicine, Wimpole-street, which are to be used for several of the meetings of the Royal Institute this year whilst the alterations are being carried out at Conduit-street.

The Council Dinner.

Amongst the guests of the Council invited to dinner before the meeting were Lord Sumner; Lord Riddell; Sir Aston Webb, P.R.A.; Sir Ryland Adkins, K.C., M.P., (Chairman, Northants C.C.); Mr. H. J. Waring, M.S., B.Sc., F.R.C.S. (Vice-Chancellor, University of London); Sir W. Hale-White, K.B.E., F.R.C.P. (President, Royal Society of Medicine); Sir Richard Winfrey, M.P.; Mr. Owen Parker, M.P.; Mr. J. C. Squire (President of the Architecture Club); Mr. E. J. Partridge (President of the Society of Architects); Mr. W. R. Davies, C.B. (Board of Education); Mr. Sydney Smith (Chairman, Kettering Urban District Council); Mr. H. G. Gotch, C.A., J.P.; Mr. Ernest Hopwood; Mr. John Bond (Town Clerk of Kettering); Mr. T. C. Gotch; Mr. W. Curtis Green, A.R.A.; Mr. A. Jacobs (Director, Wolseley Motors, Ltd.).

INAUGURAL ADDRESS.

After the preliminary business of the meeting, the President (Mr. J. Alfred Gotch, F.S.A.) delivered his inaugural address as follows:—

It requires no profound thought to become aware that an idea may be expressed in different ways; one way may be bald, the other beautiful; one may be the merest statement of facts, another may present those facts so aptly or in such charming language that we ever afterwards recall them with delight. It is not improbable that, meeting here to-night after a long interval of separation, we may have discussed the weather, we may have recalled the inclement spring, we may have praised the summer for everything but its spells of excessive heat and its brief duration. If we have done so, no one will bear our commonplaces long in mind. They were merely bald observations to pass the time, forgotten as soon as made. But how does the poet handle the same theme?

" Shall I compare thee to a summer's day?
Thou art more lovely and more temperate;
Rough winds do shake the darling buds of May,
And summer's lease hath all too short a date."

Or, suppose that a student of architecture takes advantage of summer's lease while it is still running, and goes, let us say, to the south of France on a sketching tour. He has toiled up on a hot day to Roquebrune or to Gourdon, or to some other ancient and interesting village perched upon a hill. What is his first desire on reaching his destination, a desire that takes precedence over the most delightful sketching? It is to quench his thirst. This laudable wish—still laudable, at any rate, in the Old World—he may well gratify by calling for a bottle of the *vin du pays*, with ice if possible. All quite matter-of-fact and prosaic. But how does the poet express the student's longing?

" O for a draught of vintage! that hath been
Cooled a long age in the deep-delved earth,
Tasting of Flora and the country green,
Dance, and Provençal song, and sunburnt mirth."

Just as the plainest idea can be rendered handsome by clothing it in the gorgeous raiment of poetry, so the crudest necessities of building can be ennobled by architecture. That, indeed, is one of its functions: to turn the disjointed prose of the client's sketch-plan into an organic whole, infused with the spirit of poetry: to transmute his halting murmurs into the liquid song of the nightingale. But you may say that poetry is not apt for every-day use, or even confess that you have no ear for it. Well, there is noble prose, as well as fascinating poetry. But prose, to be noble, cannot be haphazard; its words must be carefully selected and skilfully blended, chosen as well for the aptness of their meaning as the music of their sound.

I will not pursue the parallel to your discomfort, but will merely add, descending from the noble to the commonplace, that even an advertisement is more likely to be efficacious if couched in reasonable prose than if presented in the form of a crisp but odiously familiar conversation. As with noble prose, so with fine architecture: its component parts must be carefully marshalled and skilfully adjusted, apt for their purpose and agreeable to the eye; and although in small buildings the scope is narrower than in large, yet the same principles hold good in both. What is the moral to be drawn from this analogy? This, that as we are agreeably affected by fine literature without knowing exactly why, so, with like vagueness, are we impressed with good architecture. But as literary style can only be acquired by study and practice, so also can the faculty of design in architecture only be acquired by training.

This fact is sometimes overlooked by those who are about to build, especially if their intentions are not ambitious. They have been known to employ a builder or a decorator or a land agent or a house furnisher, so simple do they consider the problem to be, so prudent are they in saving the expense of an architect. But, depend upon it, with these practitioners the cost of design is always added to the bill, although it may not appear as a separate item. And, more important still, the work of design is done in such cases by men who are not trained to it—men admirable in their own occupations, but who, in the nature of things, cannot have devoted much time to studying the niceties of design; and by design I mean not merely external appearance, but the arrangement of the building, whether great or small, its aptness, its relation to the sun, the disposition of its windows, doors and fireplaces, not to mention a due supply of cupboards.

If only in the past the designing of houses had not been left to excellent (if speculating) builders, untrained for this side of their enterprise, how far less depressing, or irritating, would be the suburbs of our cities and country towns! The past is irrevocable, but the present and the future are in our own hands, and my appeal to the public is that just as when they are ill they employ a doctor, if their teeth trouble them they go to a dentist, or if they are suitors at law they seek the skill of a barrister, so if they undertake work requiring architectural design they should go to an architect; not for the sake of the architect, but for the sake of the public themselves. More especially is this necessary when it is borne in mind that the barrister and his inarticulate client, the doctor and his patient, the dentist and his victim, all die and are forgotten; whereas in architecture the results are abiding, and the sins of the fathers are visited upon the children unto the third and fourth generation.

Architecture is abiding: so it is if cl
is propitious, or, if unpropitious, is duly
into account; if motorists are some
curbed in their desire to rush through a
towns and villages; if the work of our
fathers is deemed to hold lessons for
selves. Each generation has its own vie
to this last point. Even so ponderc
matter as architecture is subject to
vagaries of fashion. It has been so thr
out its history. Greek architecture b
fashionable in Rome and decided the for
the Roman builders. Ancient Roman
tecture became fashionable in Italy o
fifteenth century, and decided the tre
design during the period we call the R
sance; Italian architecture became fashic
over the rest of Europe and gradually c
the native Gothic style of Northern coun
Gothic architecture itself had sprung an
veloped from ancient classic forms large

attack our problems on their own
guided but not enslaved by the w

t masters. Not only is the standard ring, but the number of those who im- it is increasing. The country is full of cts who do good work, work of refine- and distinction, showing careful training kill in the use of opportunities. No is London the only source whence fine cture can be obtained; other towns and he country districts can supply it: and are scores of architects unknown, per- beyond their own neighbourhood whose would have been the admiration and f their predecessors of like degree.

ake a cheerful view of the future of cture, especially when remembering the g interest shown in the subject by the at large. The civic spirit, which has so much to make us what we are, is more deeply than in bygone years by auty of art; and of all the arts, archi- e reflects the spirit of its age with most nce. The man in the street, that ulti- arbiter of our destinies, has but to raise es to behold its manifestations, whereas ork of the painter and, in slightly less , that of the sculptor, is shrouded from aze by the walls of private houses or of public institutions, entrance into requires an effort of will, and in many an outlay of money. The fact that of art are so shrouded brings home to e truth of the old saying that architec- s the mother of the arts, for pictures ne choicer sorts of sculpture have always ed, in Europe, at any rate, the protec- f walls and roof, and where there are and roof there already is, or ought to chitecture. It is the architect who first on the scene and provides the structure, he other artists who then help to embel- and take advantage of its protection to r their wares.

patronage of the public is as essential e art as to another. But workers in cture are in some respects at a dis- tage in comparison with their brothers brush and the chisel. These latter can ir own volition, and whenever the spirit them, embody their visions in tangible, form. They can fill their studios with pieces at little material expense. All hen have to do is to sell them: and if course of this proceeding it should that they find it expedient to appeal munificence of different localities, they small cost send their work from one tion to another. Not so with us archi- Before we can begin to create we have set in motion by some outside power, hen we do move we have to embody not ch our own visions as those of someone We cannot accumulate a stock of our tions as can our luckier brothers of arts, nor can we exhibit them with the facility or frequency. Indeed, no exhibi- an do justice to architecture. It can s drawings of more or less exactitude, er still, it can give us photographs. But wings and no photographs can do ade- justice to a building, inasmuch as its ance is only one out of many of its to success. Except to the initiated or imaginative, these representations tell g of its suitability, or of its disposition ation to its surroundings, and to that factor in our lives—the sun. That is we are handicapped, for just as in his- research it is hazardous to depend quotations, and it therefore becomes ary to consult original sources of in- ion, so, in attempting to form a true ent of architecture it is wiser, not to cessary, to see the building itself and depend upon the quotations which gs and photographs supply. Thus it about that architects find, to use the ge of commerce, their capital tied up eir assets far less liquid than do their artists in painting and sculpture. these disabilities apply only to the pro- making our work known to the general when once it is executed it is fully in evidence to local observers, and becomes one of the many mirrors that reflect the spirit of the age. The record of our own age lies with us; let it not be mean and contemptible, but rather let it be, by happy harmony between the public and the architect, a record fit to vie with that of the great days of Rome or the spacious times of Queen Elizabeth.

The Vote of Thanks.

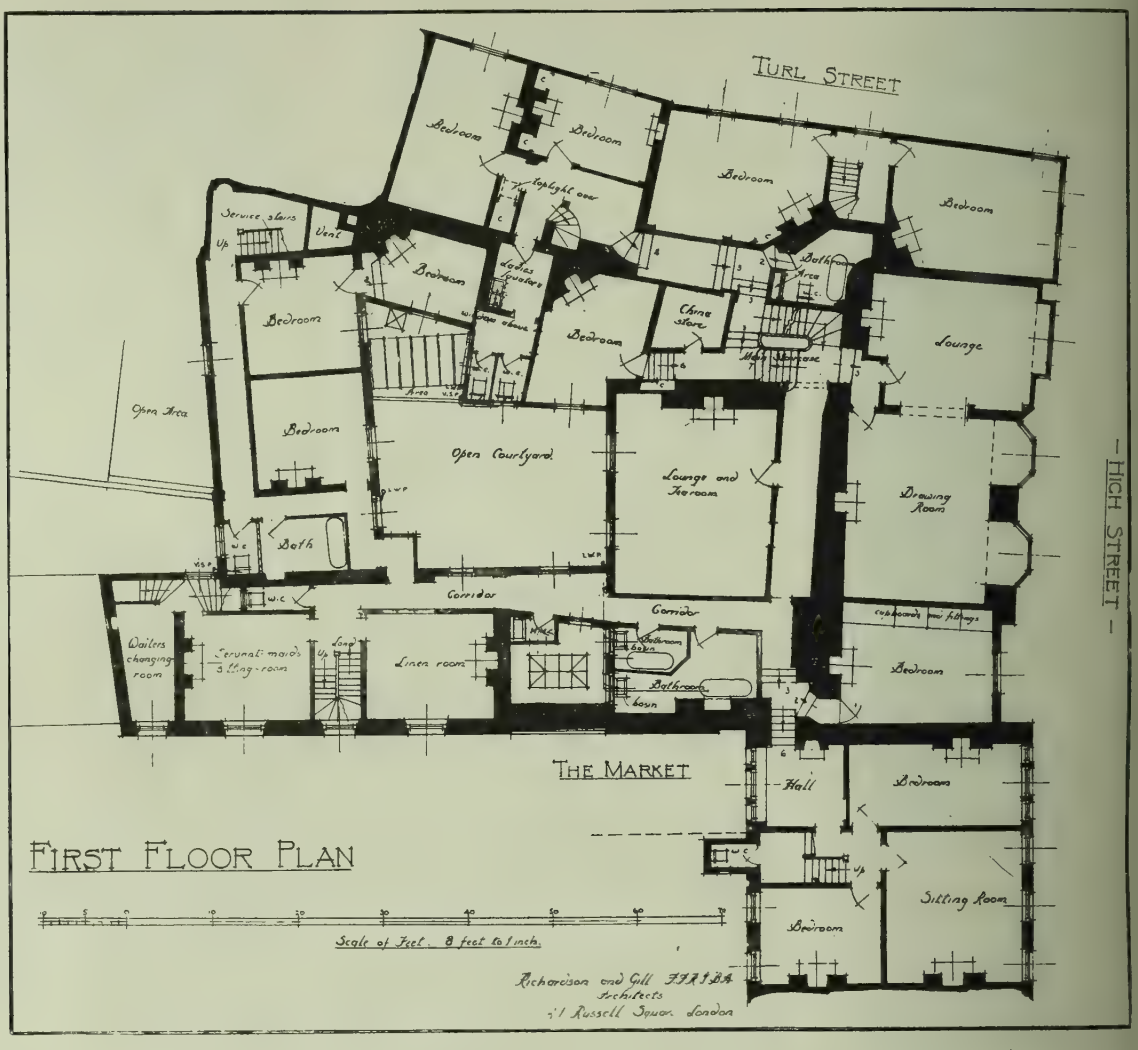
Lord Riddell, in moving a vote of thanks to the President, said the selection of Mr. Gotch as the new President marked a notable innovation in the practice of the Institute, for Mr. Gotch was a provincial architect. There were times when provincial architects were spoken of with scorn by their London brethren, but London architects had learned to fear them, and now realised that some of the most eminent men in the profession were practising in the provinces. Mr. Gotch was one of the most notable historians of architecture, and had rendered great service not only to his profession but to his country in recording interesting things about architecture and buildings and architects' practises in the past. There was one very vital point in the address to which he would like to refer, namely, the education of the public. The education of the architect was an important matter, but the education of the public was equally necessary. Nothing was more important from a municipal, ethical, or any other point of view than that the public should be educated about architecture. Nothing gave more pleasure than to understand what were beautiful buildings, and even the poorest could admire beautiful buildings. It lay within the scope of every architect to do missionary work, and architects would be well advised to approach their local newspapers with a view to obtaining greater publicity for matters appertaining to architecture. It was possible for every architect to be a missionary for good architecture, and the monstrosities to be seen to-day would never be abolished until the public were educated to an appreciation of good architecture. The President had preached the doctrine of beauty and suitability in architecture, but he had said nothing about the commercial side of architecture. He would suggest that, in addition to perfecting design, architects should perfect their business methods. In America working drawings were prepared in much greater detail than in this country, and this had the great advantage that when a client wished to depart from the drawings the architect could say, "These drawings have been very carefully thought out and to depart from them will cost a great deal of money."

The vote of thanks was seconded by Mr. Sydney Smith (Chairman of the Kettering Urban District Council), and carried with acclamation.

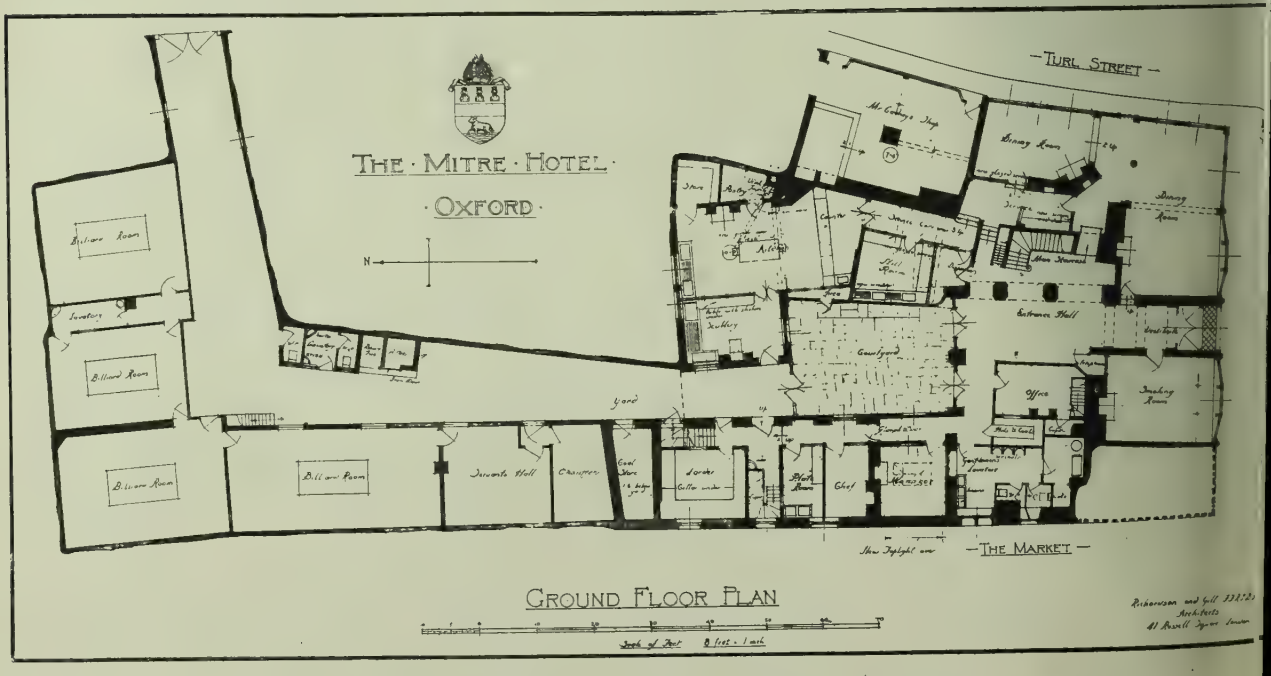
Presentation of the Street Architecture Medal.

In rising to present to Mr. Curtis Green, A.R.A., the R.I.B.A. Medal and Diploma for the Best London Street Frontage in 1922, the President said the idea of presenting a medal to the architect of the best street frontage in London built during the year was an entirely new one in this country, although it had been accepted in France and America for some time. The presentation of such a medal in London was due to the suggestions of two late Presidents, Mr. Hare and Mr. Simpson, and the scheme was a very valuable one, inasmuch as it interested both the client and the public. Also it helped to improve commercial architecture, and to acknowledge the merit of the architect of the successful building. Last year there was a very eminent jury, including Lord Crawford and Balcarres, the President of the Royal Academy, the President of the Royal Institute of British Architects, Sir Reginald Blomfield, and Mr. Guy Dawber, who had great difficulty in deciding for which building to award the prize. Eventually, however, it was awarded for the Wolseley Building in Piccadilly, designed by Mr. Curtis Green, A.R.A., and he (the speaker) was fully satisfied with the justice of the award. Anyone who had seen that building, and especially the interior, would agree that it was a most beautiful design, and particularly apt for its purpose. It showed a great knowledge of detail, and was worked out with infinite care; the colour and choice of material, also, were extremely satisfying. The bronze medal had been designed by Mr. Langford Jones, and in addition to the medal a diploma signed by the jury would be presented to the winner.

In returning thanks after receiving the medal and diploma, Mr. Curtis Green said he was very fortunate—he thought any architect was fortunate who had a client who would build within four miles of Charing Cross. He was particularly fortunate in his clients, Messrs. Wolseley Motors, Ltd., who had the foresight—unusual in this country—of seeing that architecture was a commercial asset. They spared nothing to make Wolseley House worthy of a great business undertaking. He had heard it said that such a building must add considerably to the cost of the Wolseley car, but, as a matter of fact, the cost of that building was not taken in account at all in fixing the selling price of the firm's products. The fact that many laymen as well as architects had spoken of their liking for Wolseley House was encouraging, and an indication that they welcomed a return to the traditional lines of Wren. He was grateful for the kindly appreciation of Wolseley House, but he was under no delusion himself about its merits. He had seen an American paper in which he read something as follows—"Wolseley House is the sort of thing we are accustomed to in America. It is not very good, but the inside is interesting." Wolseley House owed something to America, particularly to McKim; it owed something to Letarouilly, and perhaps more fundamentally to Gibbs. In plan and composition it owed nothing to the past. Had he had the training some of the younger men were getting to-day and the experience of previous opportunities such as their American friends had, the design would perhaps have been developed more freshly. The American architect went from one great building to another with the ease which came from constant practice. In this country such opportunities were few and far between. Robert Louis Stevenson used to read page after page from the great masters of English literature to acquire technique. To the younger architects he would say, "Orders, lovely as they are, are the beginning and not the end of architecture." The orders were the grammar of the art; they should be learnt as Stevenson learned to read English, and learned so well that the students would be freed from the books once and for all: they would then be in a position to speak to the public and to one another in a language that was common property: they would all be free to produce living architecture such as was produced by the mere handful of architects who had done so, and whose work was held in esteem to-day.



Portrait of Mr. Paul Waterhouse.



The President then unveiled the portrait, painted by Sir William Orpen, of Mr. Paul Waterhouse (Past President), which would, he said, join that of Mr. Waterhouse's eminent father, an event which had not previously occurred in the history of the Institute.

A few words by Mr. Waterhouse, in which he expressed his appreciation of the kindness and help he had received during his term of office, terminated the meeting.

Obituary.

The death is announced, on November 3, at 1, Cornwall-terrace, Regent's Park, London, f Thomas Durrans, A.R.I.B.A., aged 73.

Chesham House, Regent Street.

building will extend over the whole of ock bounded by Regent-street, Beak- Warwick-street and Regent-place, with ception of one plot at the south-east No. 35, Warwick-street.

basement, ground and portions of the id sixth floors will be occupied as shops, and workrooms; the remainder of the nd sixth floors and the whole of the , third, fourth and fifth floors are intended sed as offices. The offices will be served entrances from Regent-street, and one e from Warwick-street, with staircases ts. The walls of the staircases will be ly lined with marble.

building will be of steel frame con- on faced on the front and two returns Portland stone, and on Warwick-street alt-glazed bricks to first floor level and cks above with Portland stone cornices, , &c. The floors and roof will be of e, and the latter covered with asphalte, e mansards facing Warwick-street will ered with Westmorland green slating. will be nine lifts, four on the public ses, one goods, and five in connection ne shops. Seven of these lifts are being d by Messrs. Waygood-Otis, and two by press Lift Co. The shop fronts will have sashes with marble plinth.

srs. Henry Tanner are the architects.

building contractors are Messrs. Bovis, The building is to be carried out in two s, the first section comprising the two rnmost shops and offices above. The ictional steelwork is being executed by . Moreland, Hayne & Co.; the steel nts by the Crittall Manufacturing Co.; lights by Messrs. Henry Hope & Sons; cement to floors by the British Reinforced te Co.; pavement lights by Messrs. King & Co.; stone staircases by the ia Stone Co.; red facing bricks by Messrs. Lawrence & Sons; electric light and by Messrs. Jackson & Boyce; heating ot water, by Messrs. J. H. Nicholson; partition blocks by the Leeds Fireclay Other contractors who have work on n 1 are: Messrs. Jones & Willis for rading; Messrs. Elwood for enclosures in staircases; and Messrs. J. & A. Crew rble wall lining to staircase.

D.I.C. House, Manchester.

first premiated design in the D.I.C. , Manchester, Competition, by Messrs. Prestwich & Sons, is given this week.

Cambridge Collegiate Buildings.

The design for Collegiate Buildings at Cambridge, by Mr. Herbert J. Rowse, A.R.I.B.A., and Mr. Lionel B. Budden, M.A., A.R.I.B.A., was placed first in the recent competition. A review of the design submitted is given on p. 716.

The "Mitre" Hotel, Oxford.

It was found necessary completely to rearrange the internal accommodation of the ground floor of this building without disturbing the historical features. The kitchen has been transferred to a better situation to avoid a service crossing the entrance hall as formerly. New lavatories have been installed, and the nineteenth-century buildings which stood in the courtyard have been removed. Other alterations have included a new extension to the dining-room, the repair to existing portions of the building, new drainage, and the preservation of the ancient vaults in the basement. Some notes on the history of the building are given on p. 717.

The architects are Messrs. Richardson & Gill, FF.R.I.B.A., 41, Russell-square, W.C.1, and the work was carried out by Messrs. J. Knowles & Sons, of Oxford.

Additions to the Bland-Sutton Institute of Pathology, The Middlesex Hospital.

The Committee of the Medical School of the Middlesex Hospital decided early in the year to increase the accommodation for Pathological Research in their Institute of Pathology, which was built in 1914–1915 and named after Sir John Bland-Sutton, who contributed very largely towards the cost of building.

The original building was designed by Mr. Keith Young, F.R.I.B.A., then architect to the Hospital, and consisted on the ground floor of administrative offices for Dean and Director, and a large lecture theatre. On the first floor was arranged the large Pathological Museum and gallery, and two large practical research classrooms. The second floor consisted of two large laboratories and a series of six small research rooms for special work, where the routine hospital examinations are made. The new top floor, as shown on the plan and illustrated by the photographs in this issue, was designed and carried out by Mr. Alner W. Hall, F.R.I.B.A., who was appointed architect to the Hospital in 1922, when Mr. Keith Young retired and was appointed consulting architect. The extension is in the form of a mansard roof constructed of steel and concrete with large dormers having steel casement windows, which ensure the maximum amount of light possible. The accommodation consists of the Director's office and private laboratory, with a Secretary's office and library immediately opposite. On the northern side is one large laboratory for public health work, and on the southern side are two smaller research laboratories. In the original building the semicircular corner was a staircase on all floors. This has been removed, and the space made available for more rooms, used principally for preparation purposes. A lift is installed in the western staircase.

The whole department is fitted up with all the necessary cupboards, benches, sinks, &c., all the wood fittings being made of teak. In the construction of the flat it was desired to take every precaution to ensure an even temperature; it was therefore decided to insulate the space between the top of the concrete and the finished flat level by a cushion of air. This was done by slabbing over the whole roof with 2-in. slabs carried flat on bricks-on-edge, honeycombed, with a complete air-space from end to end with air gratings in the end walls. On the top of the slabs is the finished surface of 1½-in. cement and "Pudlo."

Messrs. Trollope & Colls were the general contractors. The heating and hot-water was carried out by Messrs. James Slater & Co. All the plumbing and sanitary and laboratory sinks by Messrs. Dent & Hellyer; casement windows by Messrs. Burt & Potts; tiles by Messrs. Roberts, Adlard; terrazzo flooring by Messrs. Diespeker; lift by Messrs. Waygood-Otis; electric lighting and telephones by Messrs. Girdlestone & Co. Messrs. Trollope & Colls made all the teak fittings. The steelwork was carried out by the Fawcett Construction Company; the invisible gearing for fanlights was made and fixed by the Light Steelwork Company.

Nos. 75–78, Sloane-street.

The illustrations show these houses as they existed previous to their conversion into a block of flats, and the completed buildings.

The three houses were private residences, one occupied by the late Sir Herbert Beerbohm Tree and the other for many years by the late Sir Charles Dilke. The staircases of the three houses have been removed and the floors filled in, and a new staircase and additional rooms have been provided in the rear so as to form a suite of flats, consisting of two reception rooms and six bedrooms on each floor in addition to offices.

The roof of the corner house has been removed and two stories added, and the elevation of the two other residences has been brought into line, old bricks being used for that purpose. The new entrance is now at No. 78; the porch at No. 76 has been transformed into a bay window; the conservatory and covered verandah above have been removed and an additional story has been added to the bay, which has been carried round the elevation to Pavilion-road, thus providing a corner feature.

The space at the rear of these residences has been utilised for the erection of garages and men's rooms over, in keeping with the general character of the front elevation.

The general contractors were Messrs. W. H. Lorden & Son, Ltd., with the following subcontractors:—Steelwork, Messrs. Young & Co.; heating installation, Messrs. Haden & Sons; lifts, Messrs. Waygood, Ltd.; electric installation, Messrs. H. Page & Co.; wrought iron work, Messrs. Jones & Willis.

The architect is Mr. Paul Hoffmann, of Capel House, E.C.2.

MEETINGS.

FRIDAY, *November* 9.

Architectural Association.—Members' Musical Evening. At 34, Bedford-square, W.C.1. 8 p.m.

Chadwick Public Lectures.—Major H. Barnes on "Preventive Hygiene, Health, and Town Planning." At 18, John-street, W.C.2. 8 p.m.

London Society.—Sir Frank Baines on "Hampton Court." At 18, John-street, Adelphi, W.C.2. 5 p.m.

Town-Planning Institute.—Presidential Address. At 92, Victoria-street, S.W.1. 6 p.m.

MONDAY, *November* 12.

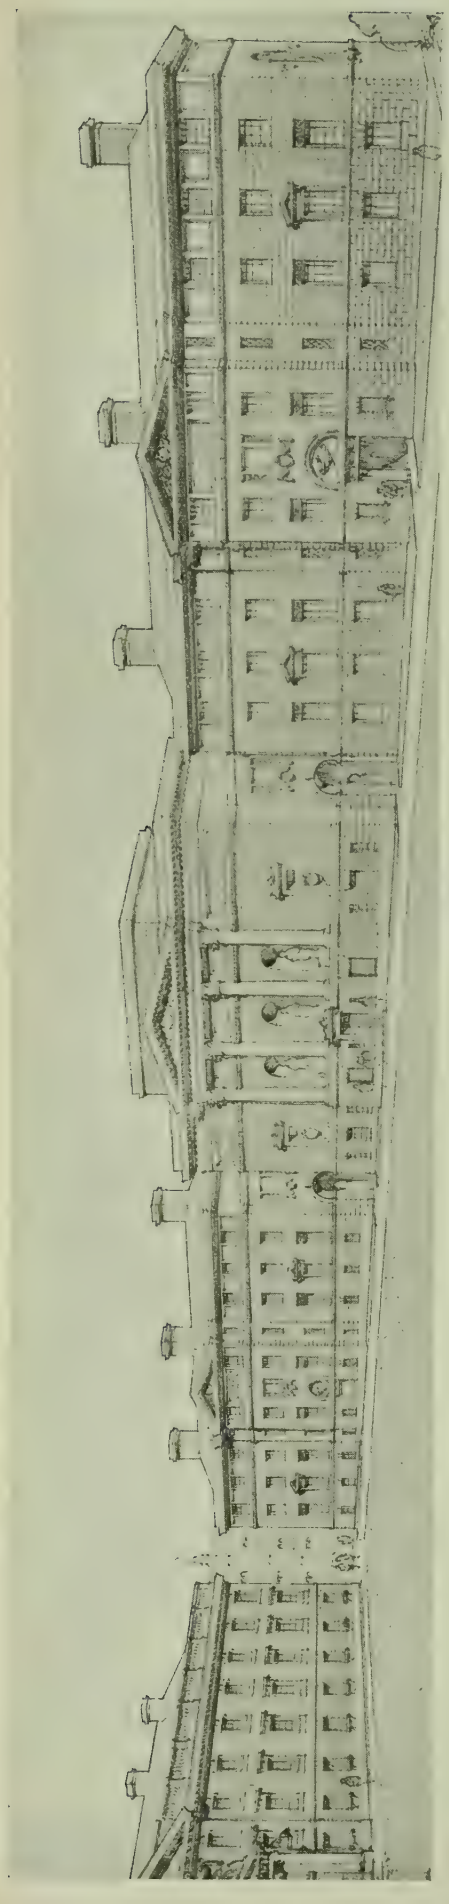
Surveyors' Institution.—President's Opening Address. At 12, Great George-street, S.W.1. 8 p.m.

TUESDAY, *November* 13.

Illuminating Engineering Society.—Reports on progress during the Vacation, and Developments in Lamps and Lighting Appliances. At 18, John-street, Adelphi, W.C.2. 8 p.m.

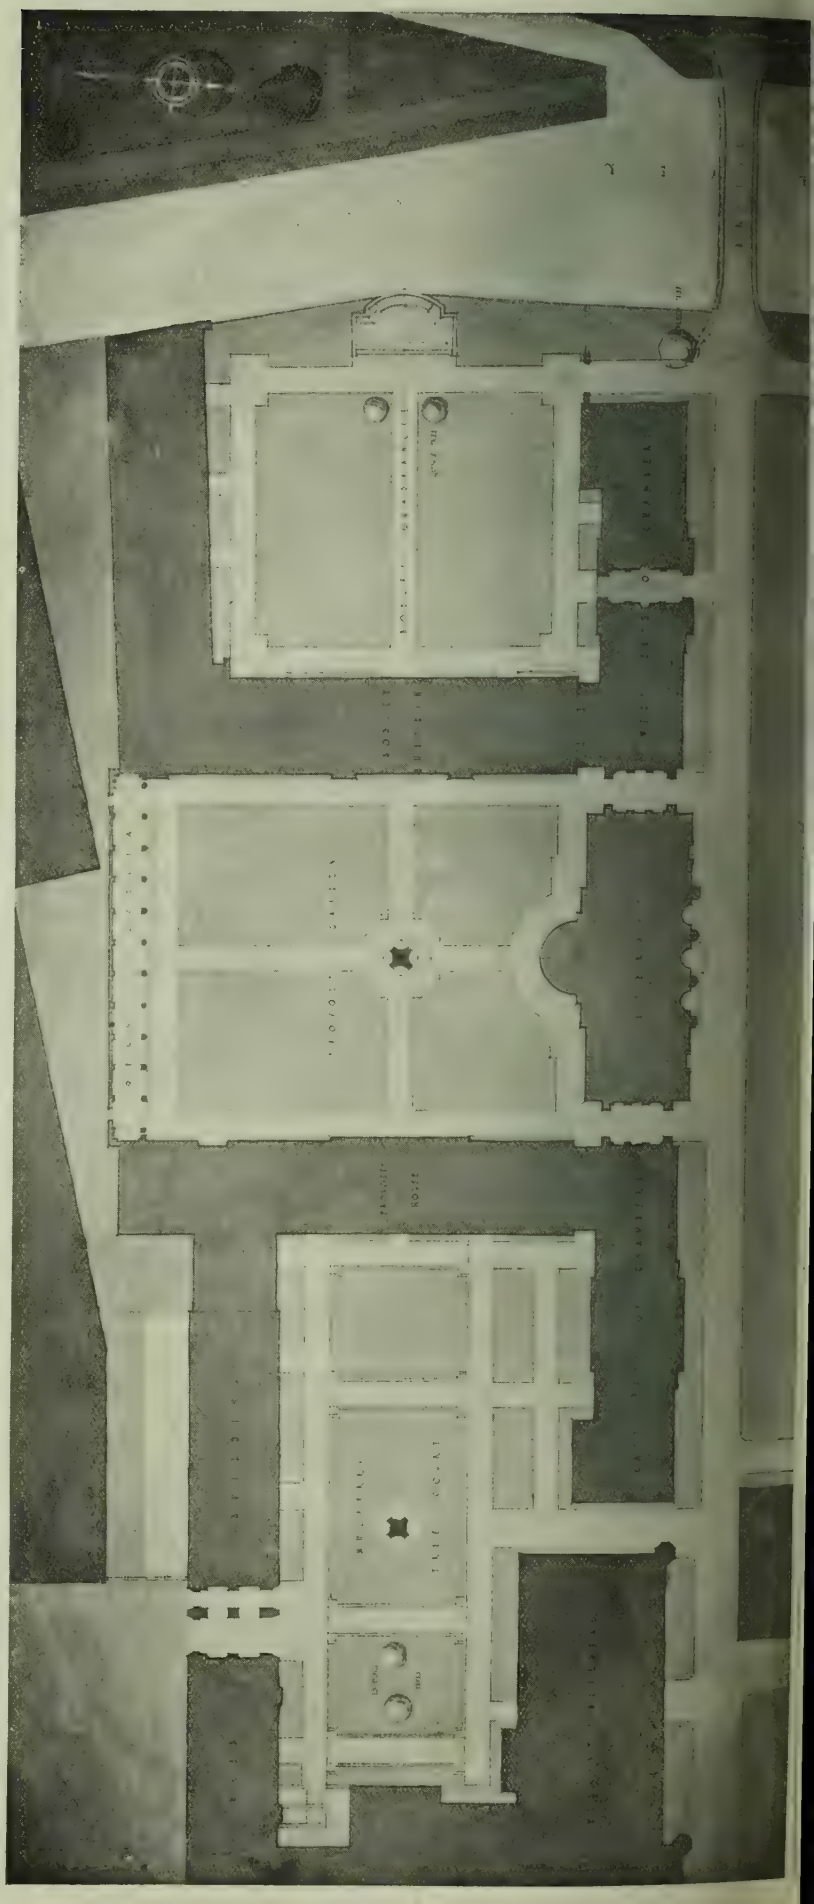
Society for the Promotion of Roman Studies.—Professor H. J. Rose on "Inauguration of Numa." At Burlington House, W.1., 4.30 p.m.

Incorporated Institute of British Decorators.—Mr. T. Peters on "Visit to Italy by a Decorator who does some Landscape Painting." At Darlington. 7.30 p.m.

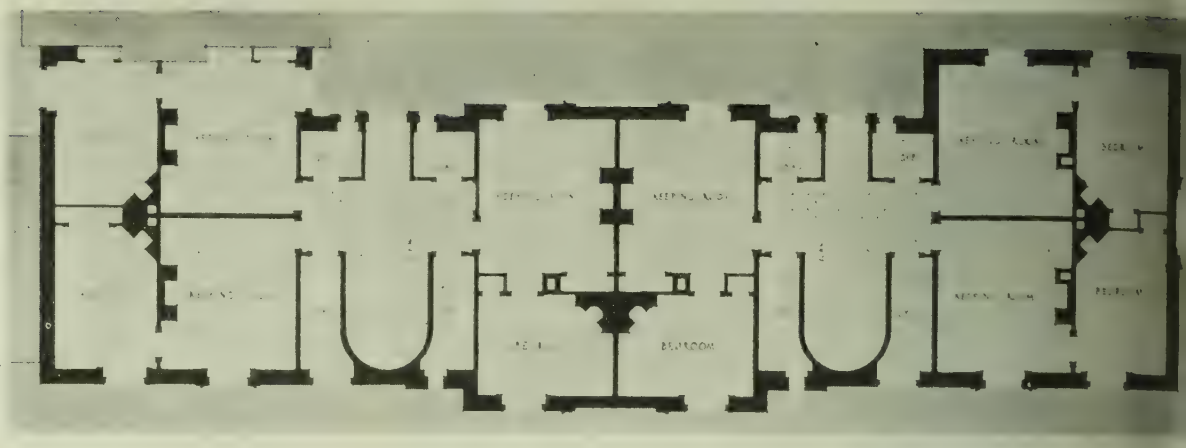


WEDNESDAY, *November* 14.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Greek Architecture." At Southampton-row, W.C.1. 6 p.m.



Royal Academy of Arts.—Professor A. P. Laurie on "Early Methods of Oil Painting." At Burlington House, Piccadilly, W.1. 4 p.m.



THURSDAY, *November* 15.

Incorporated Institute of British Decorators.—Mr. W. J. Pearce on "How, When and Where to Use Colour and Ornament." At Painter's Hall E.C.4. 7.30 p.m.

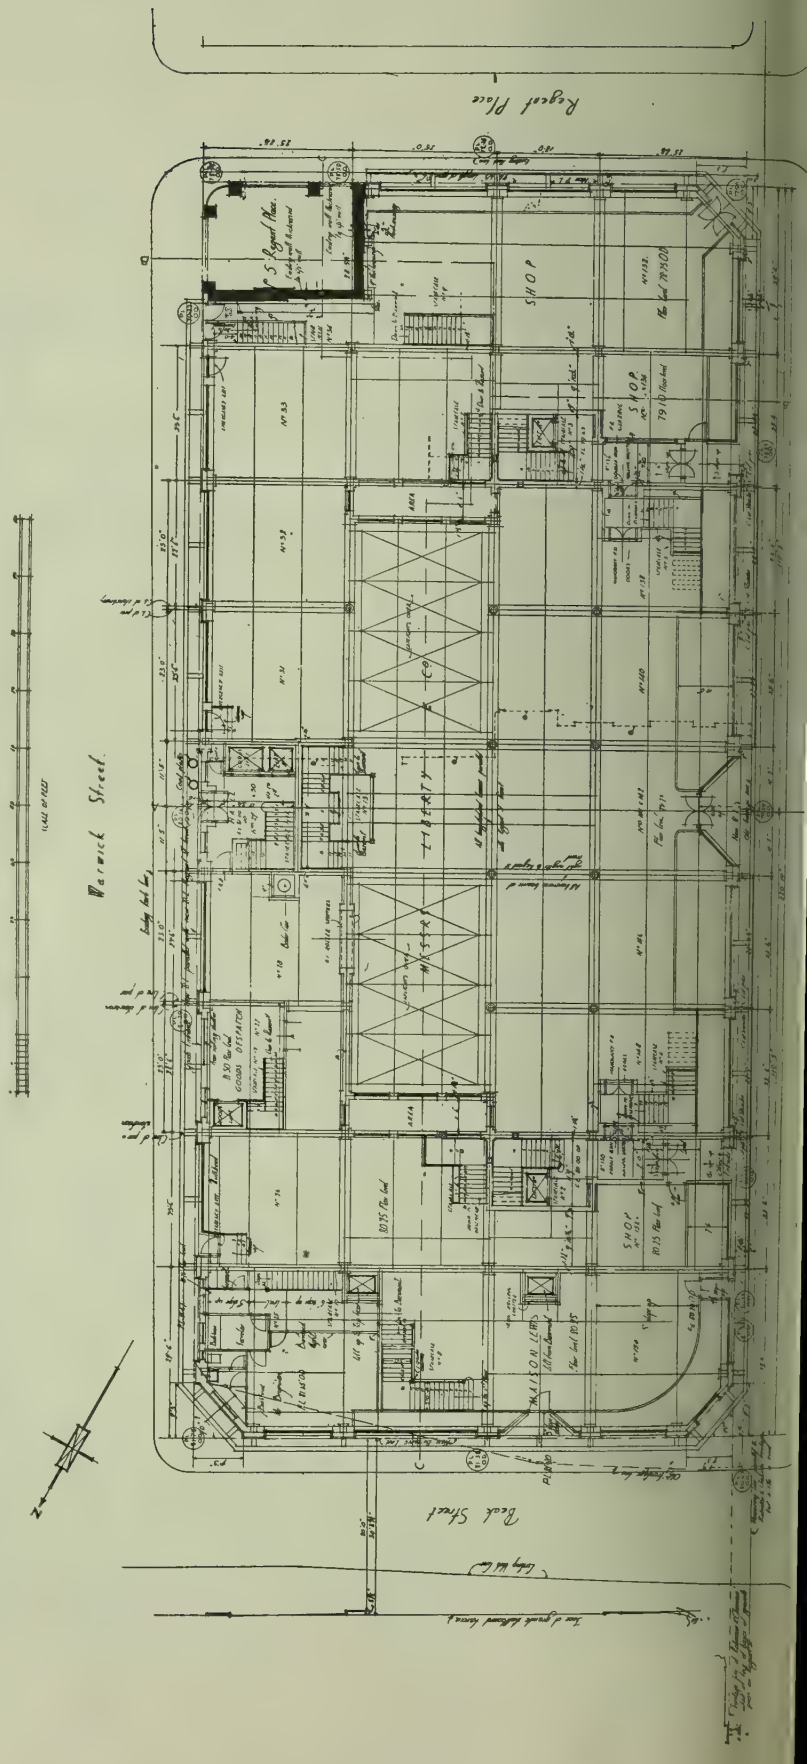
EXHIBITION NOTES.

THE ROYAL WATER-COLOUR SOCIETY.



THERE is certain pleasure in store for those who appreciate water-colour art in the present exhibition of the R.W.S. in Pall Mall. The good things are not scarce, and it is a welcome sign that so much is being done in low-toned and non-theatrical painting. Such pictures as Nos. 29, 31, 38, 59, 60, 81, 84, 106, 112, 122, 156, 192 and 198 at once compel one's interest. Oliver Hall, S. J. Lamorna Birch, Frank Brangwyn, W. T. Wood, E. T. Holding, Harry Watson, A. Reginald Smith, R. Thorne-Waite, and Jas. Paterson are amongst the mainstays of an excellent exhibition. Harry Watson's simply expressed "Departing Day" (12), Oliver Hall's fine study of "Dorset Barns" (8), E. T. Holding's admirably transparent "Black Country" (7), Sir Hughes-Stanton's fine "Sunrise, Athens" (26), S. J. Lamorna Birch's charming decorative drawing of "The Silent River," Henry Rushbury's graphic monochrome of "The Market Place, Assisi" (41), Harry Watson's vivid "Welsh Moorland" (78), Nelson Dawson's dainty and poetic drawing in warm greys of "Daybreak" (102), and Cecil Hunt's finely drawn "Arco" (101), are only some of the subjects which one might particularise for their artistic vision and skilful technique. Whether we are as progressive as we might be is possibly doubtful, but we are honestly glad to find so much sincere and able work by artists who do something to uphold to-day the reputation of English and Scotch water-colour art.

COTSWOLD GALLERIES.

In the pleasant little Cotswold Galleries is a small exhibition by Cotswold and other artists, amongst which we find nothing of outstanding interest. The tight handling of some of the drawings and unhappy composition of others suggest a lack of artistic inspiration and freedom of outlook. Mr. Griggs seems happiest in black-and-white, W. T. Wood has a dainty drawing of "Early Spring in Kew Gardens," Kenneth Hobson has a nice drawing of "Ludlow Castle," and Chas. M. Gere and Margaret Gere make pleasant contributions.

DRAWINGS BY MR. GERALD MOIRA.

The brilliant sketches by Mr. Gerald Moira at the Beaux-Arts Gallery in Bruton-place have quite a fresh interest for those who have associated his name with the production of elaborate decorative work. There is a spontaneity and fascinating quality of gay luminous colour in some of these sketches which make them very attractive; most of them are recent and have not been seen before. The "Peasant Funeral in France" is very admirable, and in its colour and drawing finely depicts the subject. The sense of scale conveyed in the grouped figures behind the great curtain in the "Russian Ballet," and the fine drawing of the "Long Water, Kensington Gardens" and "Bathing" are specially noticeable. The interesting panel of "The Cornish Floral Dance" shows what a natural and easy instinct the artist has for decorative values, whilst his two other drawings hung on either side, "The Spirit of the Slag-heap" and "The Lapis Pool," have a distinction of design in drawing and colour which do not come to many artists. We hope we shall see more of the lighter side of this able artist's work. In the gallery of Mr. Frederick Lassore, the sculptor, is fixed a large mural painting by Moira entitled "Sacrifice, a Proposed War Memorial Painting," which is admirable in its composition. We venture to think the little child in the centre of the foreground would have functioned better in the design if it had less of a set pose and not so very apparently making a direct appeal to the beholder. We know it is easy to criticise, but we are also sure this is not the very best this accomplished painter can do.

Chesham House, Regent-street.

MESSRS. HENRY TANNER, Architects.

THE "BRISTOL" CHALET AND BUNGALOWS.*

By MANNING ROBERTSON, A.R.I.B.A.

eople will agree that in respect to the of houses we have had a sufficiency of ibly a surfeit of talk. Not that talk t value; on the contrary, the mere a of the necessity of reform undoubt- a powerful influence in convincing the at something must be done—if only e talk. The Chairman of the Bristol Committee, Councillor E. W. Savory, come forward with a proposal for using, involving departures from the ule both as to design and construction. artures raise the important question r it is justifiable to modify our pre- standards in order to meet an emerg- h is little less than a menace to our

In the attempt to find a solution ely justified in making any experiment hoose, within certain strictly defined s, which may be described under the three heads :—

house must be one in which a family health and with at least a reasonable comfort. This means that it must be adequately lighted and ventilated, ssential amenities such as baths and must be provided, and that the sexes iven separate accommodation.

house must be reasonably durable. ss to build shanties that can only last teen years, since we cannot allow to be faced with rebuilding in 1935, our energies will then obviously be rbed in keeping pace with current

houses we build must not spoil fresh ountry; in other words, they must need not be ugly.

two essentials constitute boundaries ch we may not carry economy. The ly concerns the financial side at all, ands a little knowledge and thought rt of the designer. Nothing more.

be said at once that the "Bristol" the two bungalows appear to conform with these three points, but before the suggestions in detail it is import- phasise that only in those districts al authorities really mean business ny chance of adopting this suggested onstruction, or anything like it. It ole to overstate the responsibility at orne by local authorities. If they usiastically upon a serious attempt the problem of their local housing nd are prepared to use their powers the obsolete, or—for the moment— ent, demands of their by-laws, the ear to a move forward, since each can summon a conference and ascer- can be done in the way of erecting ses in the district, consideration n to local conditions, such as the of ballast, clinker, sand, bricks, &c.; oment a local authority forgets that inst a live problem requiring common settlement, and adopts the attitude t's silly, but it's on page 26, para. 3, k of by-laws," the situation is next peless. It is true that section 13 of Housing Act gives the Ministry of wer to force a change where by-laws ring progress, yet the time wasted this into operation, and the ill- endered in such proceedings, mean in hat much valuable time is lost, and manent drag is applied. To suggest local authorities regard their by-laws nct revelations from Heaven is not them of dishonesty, rather they are a misguided zeal. They gain nothing ld but obloquy and abuse—but they using.

It is useless to devise methods for clearing the second hurdle until the first is successfully surmounted, and in considering the Bristol proposal we must assume that the local authority of the district concerned has vaulted its own ringed fence and is really anxious to co-operate in sensible proposals, even though they be new ones. Granted that this be the case, how far would the Bristol proposal help in the present crisis? We have, unfortunately, no exact figures of cost, the original estimate of £195 being admittedly too low, but it is at least certain that in most districts houses built on the Bristol method would be considerably cheaper to build than the ordinary brick or concrete house. It would be of the greatest value to build some experimental bungalows in different districts and to compare the cost with that of ordinary houses of the same size.

Mr. Savory would probably be the first to admit that his plans are not ideal, and he would no doubt point out that his method of construction can be applied to any other bungalow plan, but he would probably say that his plans represent the limits to which concessions can properly be made under point (1). A bath in the scullery is, of course, not ideal, but it is so much better than not providing a bath at all that the economy of omitting a separate bathroom may be justified, especially when the scullery is not a passage room. The plan of Bristol Bungalow No. 2 might be improved by placing the bath adjacent to the copper so that hot water could be provided to the bath by a direct tap. In the Bristol chalet a double bed is shown in a room 9 ft. 6 in. by 6 ft. 6 in., which seems rather optimistic; in this plan, where the living room is to be used as a child's bedroom, it is especially important to obtain the warmth of the range in the living room, but at the same time to keep the cooking as far as possible in the scullery; in the chalet in question the range backs on the scullery, and it would be easy to insert a range which had its fire in the living room, but the oven opening into the scullery. Such appliances are on the market. An iron flue may not be beautiful, but it certainly allows the products of combustion to do their share in warming the house.

The construction is, however, the important innovation, and is designed to make possible the erection of houses with the minimum of skilled labour, the shortage of which is extremely serious in almost every department of building. It seems rather a confession of bankruptcy in the year 1923 to have to revert to more primitive methods, but abnormal circumstances, complicated by the refusal of trade unions to allow of dilution, the fact that skilled men were lured away to other callings during and after the war, and have not come back, and the lack of any regular system of apprenticeship, have led to an almost hopeless deadlock. The attitude of the trade unions is, of course, due to the spectre of unemployment, and the tragedy is that the dread of future unemployment itself creates additional present-day unemployment; but any practical solution directed to relieve bottle-neck pressure in the labour market improves the general circulation and is of infinitely greater value to the community than a hundred political panaceas.

The Bristol construction consists of a steel skeleton carrying steel roof trusses which, except in the bedroom, are exposed; heavy galvanised iron sheets tarred both sides are laid with corrugations horizontal to form the outside of the wall, and a 4 in. air space separates the galvanised iron from a 4 in. wall built of breeze blocks. Clinker would be far more reliable than breeze for the inside walls, and care would have to be taken to keep the steel framework entirely free from the clinker. It should be possible to carry the elimination of skilled labour from these houses a stage further by omitting the internal plastering and by nailing asbestos cement sheets direct to the clinker face and papering or distempering over. The floors of the living rooms and bedrooms are of one inch boards nailed to fillets secured in the concrete. Here there would be serious danger of dry-rot, especially if linoleum were laid, or improperly-seasoned wood used, and one might suggest that a form of jointless flooring not colder underfoot than linoleum would obviate the risk of dry-rot and at the same time be easier to clean. The roof is shown tiled with an ornate bargeboard that might well be plain or omitted altogether and an 18 in. projection is given to the eaves. This eaves projection would add enormously to the appearance of the houses, and since good appearance nearly always has some structural significance, the heavy projection would save the walls from full exposure to rain and thus materially lengthen their life. Mr. Savory considers that these bungalows should last 50 years, and they would no doubt do so if the iron were kept tarred at frequent intervals, but in industrial towns any carelessness that resulted in exposing the galvanised iron would result in its disintegration in a very short time, although even then it would not be difficult to renew.

If, as one hopes, this movement towards greater freedom spreads, it is of the utmost importance that designers should realise that the appearance of these chalets and bungalows will depend, not upon adding so-called ornament, but upon preserving good proportions in doors and windows, a good variety of colour in the tiled or slated roof, a good eaves projection, and possibly simple trellis porches. Too great a degree of standardisation would be highly undesirable, but even to admit complete uniformity would be better than to attempt to differentiate one from the other—to give individuality—by sticking on any kind of useless and applied ornament.

Finally, it must be confessed that the unceiled rooms in these bungalows would be cold in winter and hot in summer, but it may well be argued that it is better to live in a dry and comfortable house that was rather extreme in its variation of temperature than to exist in a damp, dark cellar or a leaky attic while people outside were talking about building the ideally cosy home.

An Old Fireplace, the "Mitre" Hotel, Oxford. *(See p. 717.)*

Housing Losses.

The loss upon the Assisted Housing Scheme at Coventry for the year ending March 31 last is now reported as £38,240 11s. 1d., of which the City Council contributed £2,097 18s. 5d. (the proceeds of a 1d. rate), and the Government £36,142 12s. 8d. The scheme comprises 579 permanent houses and 738 temporary houses in converted hostels, a market arcade or shopping centre at the Holbrooks, and men's hostels at Whitmore Park. The Council have still 50 houses in course of erection and vacant sites of about 148 acres.

se were illustrated in our last issue.

THE PROPOSED NEW BUILDING FOR THE INTERNATIONAL LABOUR OFFICE, GENEVA.

THE report of the jury appointed to adjudicate on the designs submitted in the recent international competition has some points which may be of general interest. It will be remembered that the competition promoted by the International Labour Office of the League of Nations was open to Swiss architects and those of "Allied" nationality who had practised in Switzerland for at least ten years. As a consequence it is not, perhaps, surprising that among the 69 sets submitted there do not appear to have been any by British architects.

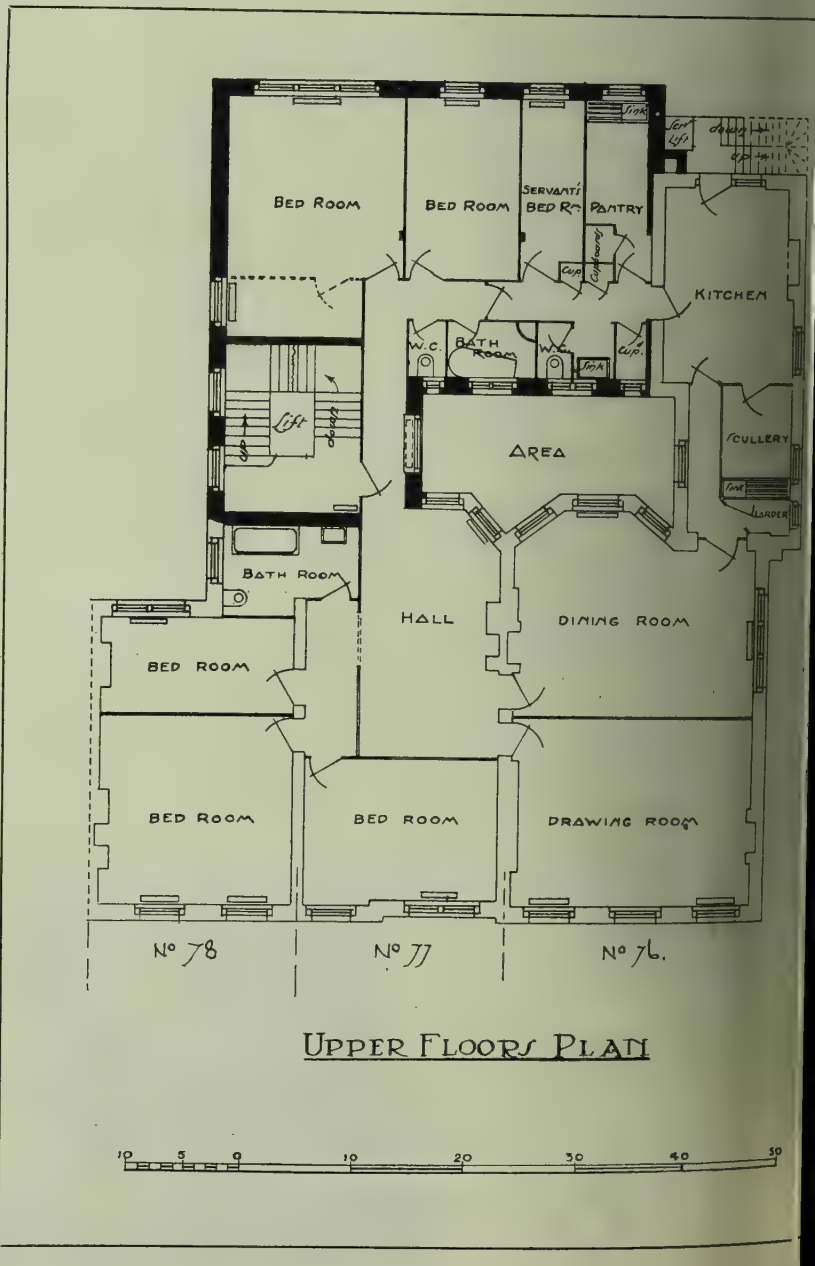
The jury was composed of a representative of the promoters, M. Fontaine, President of the Council of the International Labour Office; of the Swiss Federal Government, M. Usteri; of the I.L.O., Assistant-Director of the International Labour Office; and four architects—MM. M. Brincourt, Société Centrale (France), A. Guyonnet and M. Turrettini, Société Suisse des Ingenieurs et Architectes (Switzerland), and Mr. E. P. Warren, F.R.I.B.A. (Great Britain).

The programme of the competition was well drafted and gave full particulars of the accommodation required, the nature of the site (which was also shown by several photographs), and made it clear that the estimate of cost calculated on the basis of 50 francs (Swiss) per cubic metre must not exceed a total of 2,500,000 francs.

It is satisfactory to note that the jury, in their award, have taken all these points into consideration and, in consequence, arrived at the conclusion that none of the schemes submitted could be recommended for the execution of the proposed building without modification.

Before proceeding to examine the designs sent in the jury listened to an address by M. Albert Thomas, Director of the International Labour Office, on the purpose of the proposed new building, and inspected the site, accompanied by Mr. Lloyd, Chief of the Administrative Staff of the Bureau.

The examination of the designs followed the usual system of progressive elimination at successive meetings, although one set was immediately put "Hors concours" on account of "complete negligence of study and in the presentation of the project." The eleven sets which remained after the third session were subjected to a careful examination as to their "cubing," and the jury arrived at the conclusion that a margin of 5 per cent. could be admitted; in other words, that a total cube of 52,500 metres in place of the 50,000 given by the strict interpretation would be permissible. As a result of this verification of the estimates five of the remaining designs were eliminated, and in their report the jury express regret that the authors of several interesting designs did not pay sufficient attention to the very definite instructions on this subject contained in the programme. It was decided that five premiums should be awarded, but that no first prize should be given, as none of the designs was of sufficient merit to be recommended for execution.



A detailed criticism of the remaining designs follows, of which it will suffice to give a translation of the remarks on the design placed first—No. 46, motto "47.546 metres cube" (M. Epitaux)—illustrated in our last issue.

"Cubical contents as given, 47.546 metres cube; exact cubing, 47.546 metres cube. One of the best plans as to situation ('implantation') on the site. The unsymmetrical plan is original, but presents certain difficulties in detail. It possesses the advantage of giving nearly all the offices a share of sunlight. The general dispositions of the plan are clear. The principal staircase is too important, and its connections with the secondary staircases are not happy. The grouping of the administration offices on the right and those of the Council, Director, and the Library on the left is an advantage. Certain details were defective. The President's room is too small and badly proportioned, and the lighting of a part of the library by a lantern is perhaps not sufficient, and the same criticism applies in the case of ventilation. The façades are simple and well proportioned. Architectural features on the front facing the lake add importance to the two garden entrances, and add interest to this too monotonous façade. This design is in accordance with the conditions of the programme, and has the advantage of a cubical content to that of most of the other sets."

The jury conclude their report following observations: "The price per cubic metre for the construction considered as a strict minimum. It is that the Direction of the International office should endeavour to reduce the number and area of offices, &c., if it is desired that the total cost sh exceed the price of 2,500,000 francs, as (in the programme of the competition)

We give these extracts from the r this competition, as they may be of i giving an idea of the methods and p adopted in an important public co under the jury system.

ARCHITECTURAL COMPETITIONS.

llowing abstract of a paper entitled volution of the Architectural Com- read by Mr. H. V. Lanchester at l Institute of British Architects in 15. was referred to in our leading st week. and is given in view of the n the subject at the present time.

f the earliest undertakings of the stitute of British Architects was the ent of a committee to consider public ons. Their report is well worth per- I can only now give you a few as showing the point reached at the ne report. January 24, 1839.

uns as follows: "The arguments in favour of competition are suffi- rcible. Emulation is said to be the xcellence in the arts and sciences— gnised talents of the elder professor sed to be maintained in activity and e improvement, and his employers tected from the routine manner which n public patronage and private prac- oo apt to produce: while the oppor- afforded to the young aspirant to place in public estimation to which s may entitle him."

we find: "But whatever the condi- y be. they ought to be clear and that the competitor may know pre- d unequivocally upon what he has Whenever it may be expedient to lay inite instructions, they ought to be dhered to, when judgment is to be pon them, and every design rejected ll be found not to conform to them. aming instructions care should be distinguish accurately between the o be attained and the means of them. The former cannot be too ascertained, or too explicitly de- ut the latter should be left as much e to the architect, for otherwise a ope will not be afforded for the f a variety of suggestions, and one of competition will be frustrated. er, there should be a decided bias of any particular style or mode of n, it ought to be ascertained and the instructions." And in another . "The formation of the pro- pon which competitors are required heir designs becomes, therefore, the tial point for consideration, and a on this point is perhaps the most il in the present system. The pre- s to be attained, the most desirable attaining them, the circumstances control the plan with regard to the her localities, the sum of money to ed, and many other particulars in ry case of competition brings its eldom ascertained and settled so as groundwork of well-defined instruc- which competitors may proceed. decision is to be made, the judges r the first time that they have been f their own intentions; their loose gested instructions are abandoned and the architect, who has acted greatest good faith in adhering to e first to be deprived of his reward. view of the case, an architect, have suggested a design not recon- h the crude, undigested, and per- adictory preconceptions cast into nme, may virtually exclude himself mpetition, and his employers from n of his ideas."

phlet written in 1861 the late M. deals with Competitions for Public . The term "monument." of s a wider significance with the n with us, and includes all im- blic buildings. M. Daly takes the the competition is vital to archi- gress, and emphasises the follow- ion: "We require the competition sable for ascertaining periodically and definitely the direction of architectural ideas." He regards the nomination of the jury (the jury system is not questioned) as the greatest technical difficulty in a competition, on account of the demand that all schools of thought should be represented, and the difficulty that these have in finding a common ground on which a logical decision may be based. After canvassing the various interests that should be represented on the jury for an important public building, he comes to the conclusion that it should number thirteen, appointed as follows:—

L'Institut		
L'Ecole des Beaux-Arts	to nominate	
Le Conseil des Bâtiments	jointly	.. 2
Civils		
Le Comite des Monuments Historiques		.. 1
La Société Centrale des Architectes..		.. 2
L'Administration	Administrators ..	.. 2
	Laymen	.. 2
The Competitors		.. 4

He supplements this by a note that some buildings cannot be thoroughly understood without the advice of a technical expert familiar with their uses, but in a jury of the size suggested he naturally sees no difficulty in including one so qualified, either with or without a vote.

M. Daly goes at some length into the methods which should be taken by the jury to reach a decision, but in regard to these I can only refer you to his work, which is in the R.I.B.A. Library. He continues with the modifications necessary in forming the juries in provincial centres, suggesting one partly local and partly national, and at the end advocates the competition as of great importance in encouraging an active interest in architecture among the general public. He feels that were full advantage taken of the opportunities it offers in this direction, architecture might once more take the place it held in the sixteenth century as an art generally understood and widely appreciated.

In 1908 the R.I.B.A. appointed a Special Committee on the Jury System of Assessing Competitions, which reported on November 10, 1908. as follows:—

"1. That in competitions for works, estimated to cost £100,000 or over, the jury system be adopted, subject to the following conditions:—

"(*a*) That such jury shall consist of three architects of experience and ability:

"(*b*) The Chairman of such jury shall be nominated by the President, and the other members by the Competitions Committee.

"2. That in competitions for works estimated to cost between £30,000 and £100,000 there shall be one assessor and two assistants, subject to the following conditions:—

"(*a*) That the assessor shall be nominated by the President, and shall be responsible for and make the award.

"(*b*) That the assistants shall be nominated by the Competitions Committee, and their duties shall be advisory only.

"3. That in competitions for works of less value than the above the present system of assessing shall continue.

"4. That the scale of fees for assessing competitions at present set out by the R.I.B.A. be adhered to.

"It is suggested that the full fees be divided in equal shares between the three assessors after deduction of 30 guineas, which the Chairman should receive.

"A similar division should be made in the case of the assessor and two assistants.

"5. That the above Resolutions should be regarded as framed for the guidance of the President, who shall have discretion to vary their application as circumstances in particular cases may require.

"6. That, subject to the approval of the Council and the sanction of a General Meeting, the foregoing suggestions be incorporated in an official R.I.B.A. Paper headed 'Regulations as to Assessing Competitions,' with subheading as follows:—'Subject to special circumstances, which in the judgment of the President may justify their variation, the following rules should be adopted with regard to the assessing of Competitions.'

"7. That the Competitions Committee shall prepare a list of assessors for the assistance of the President. Such list to be revised from time to time, at least annually."

A Minority Report in the following terms was appended:—

"The undersigned members of the Competitions Committee, while cordially supporting the recommendations of the Committee, feel impelled to add that it is their view that the present dissatisfaction is due less to the existing methods of assessing than to the lack of any defined and recognised standard as to the qualities that should distinguish a fine building, and that in default of such a standard no system of assessing, however perfect in itself, can do more than mitigate the evil.

"They consider, therefore, that the best efforts of the R.I.B.A. should be directed towards promoting a unity of aim in regard to architectural expression. This, however, does not appear to be a question on which any immediate practical recommendation is possible, being a matter of slow growth, the outcome of a better system of education. In the meantime the absence of such unity must affect the method of assessing, and the divergence of aim and difference of opinion among architects make some application of the jury system more than ever advisable.

"They believe that a jury such as is recommended by the whole Committee for large competitions might eventually be adopted for all, provided some means of remuneration could be devised that would be generally considered reasonable. It may be pointed out that this difficulty would disappear if the view (now held by many) becomes general—viz., that the office of assessor is one of distinction rather than profit, and that architects should not allow the question of remuneration to outweigh the interests of the profession as a whole, and should be prepared to act in an honorary capacity if these interests demand it.

"In such a case, fees on the established scale might be made payable to the R.I.B.A., who would call upon its members to act as assessors for such remuneration as the competitions fund might admit."

From these sketch outlines of the history of architectural competitions it will be clear to you that knowledge has usually been very much in advance of practice. Two reasons may be adduced for this. The first is the lack of a systematic training in the profession as to what the essentials of architecture are. With the greatest artists these essentials are comprehended by intuition, and it would be unfair to expect their formulation. But in an art such as ours it is necessary to the formation of a proper judgment that they should be recognised and formulated, and this is the work for those who have the capacity to do it.

Training in architecture, in this country at any rate, has always been rather haphazard and empirical. This was not so serious when only those who had the strongest possible natural bent towards it took up the profession, but when the doors were more widely opened the educational methods should have been more definitely organised than has been the case, and the logical basis on which our art now rests made the foundation of its study. Had this been done the professional handling of competitions would have been a much easier matter and the results much more satisfactory.

The second reason why our practice does not reach our standard of knowledge lies in the necessity for compromise in dealing with promoters, who often only partially understand the real purposes of a competition, and even when they do, are technically inexperi-

enced in the methods best suited to achieve these.

Now I wish to be quite fair to promoters, and I must say that, when recommendations are put lucidly to them from a clear, logical standpoint, it is my belief that in most cases they would accept advice so supported. The responsibility for seeing that they receive this rests with the architects, and more important competitions have fallen short of the standard they might have reached by our own default than by reason of any intentional malpractice on the part of promoters.

I shall be able to deal with these points more clearly by taking the three parties to a competition in turn, and endeavouring to define the functions of each, in relation to the methods by which, in my view, they can best discharge their respective obligations.

These three parties are: (1) The promoters. (2) The assessors or jury. (3) The competitors.

The promoters may or may not schedule their requirements before inviting professional aid, but this is almost the full extent of what can be profitably undertaken without consultation with the professional advisers who are to conduct the competition. It is therefore more convenient to consider the functions of promoters and assessors together. We can realise more clearly the relationship between them if we grasp the fact that it is in every respect similar to that between client and architect during the earlier stages of any projected building work. Just as the architect gives advice on the suitability of a site, adequacy of cost, accommodation needed, and all other matters that are not predetermined by force of circumstances, so those that adjudicate in a competition should advise the promoters. The fact that a competition is to be held in no way justifies the abandonment of these preliminary consultations.

No reasonable man in employing an architect fails to consider his advice, even if he does not always take it, from the very beginning of the undertaking, and promoters ought not to deprive themselves of this, even though the ultimate architect has yet to be selected. The idea that everything must be in shape before the assessor or assessors are appointed is utterly wrong, and has been responsible for the comparative failure of many a competition.

On the architect's side this responsibility has not received much more definite recognition than with the promoters. Assessors have often failed to realise that they ought to give the same meticulous consideration to the various aspects of the proposition as they would in the case of a building they were invited to carry out themselves. It is their duty to see that the interests of the promoters suffer in no way through the successful competitor not having been in personal touch with them from the beginning, and assessors can best realise this requirement by regarding themselves as representing the unknown competitor who will ultimately take up and continue their work.

Continuity from start to finish, such as we find in non-competitive work, is the great need in competition practice. At present there is a tendency to cut it up into three distinct stages, greatly to the detriment of the result. The first stage before the appointment of the assessor or jury, the second during their appointment, and the third after the selection of the design.

To put competitive practice on a sound basis, the breaks between these stages should be bridged over, and I venture to suggest a procedure by means of which this may be achieved. I do not say that there may not be better ways: the one I put forward is merely a suggestion as to the type of procedure that might be appropriate.

Let us assume that some public body is promoting a competition and has appointed a building committee. After some preliminary discussion they would ask for the appointment of an architectural adviser, and depute two well-qualified members to confer with him, possibly the chairman and city engineer, or chairman and medical officer, according to the class of building. These three would draw up the programme. Before issuing this, two other independent architects would be added to form a jury of five, and on the programme having been agreed by them, it would be issued to competitors. The usual stages of questions, replies, and receipt of designs having been passed through under the supervision of this jury, its members would jointly make their award, dealing very fully with all the considerations necessary to inform the successful competitor as to any fresh aspect that has occurred to them during the adjudication. Their award might be in two parts—one for publication, and the other more in the nature of a confidential communication to the selected architect in order to make him conversant with problems and difficulties that may affect the further development of his design.

I do not think I need say more on the promoters' share in a competition, and will now turn my attention to the assessors.

I have often heard it said that a good architect is necessarily a good assessor, but to my mind this is not the case. The expression of personality within the confines of architectural technique is the measure of artistic quality, but the less imaginative man with a better training in technique may be superior as a judge to the greater artist who is perhaps unable to analyse the operations of his own mind.

Now the same intuition that enables an architect devoid of the analytical faculty to produce a brilliant design may empower him to select the ablest one submitted in a competition. That is not the weak spot in his equipment as an assessor. This will be discovered in the earlier stages, such as discussions with the promoters and the preparation of the programme. To place the issues properly before a clear-headed business or professional man whose experience is outside the technique of art demands a faculty of logical exposition and an experience of the difficulties involved which are not essential concomitants of imaginative force. Of course, "the legal and logical mind" is useless without artistic ability, but artistic ability is equally useless in this case if its methods are intuitive.

You will notice that in my suggestion for the conduct of a competition I have introduced one of the architects a stage earlier than his two professional brethren. I have done this in order to take advantage of employing one, specially qualified by his attitude of mind and his experience, to thrash out with laymen those points of detail and method that are so often misunderstood. He is thus "the forerunner" who paves the way for his association on the jury with one or more whose artistic qualifications may perhaps rank higher, but whose limitations in other respects might preclude their being entrusted with the conduct of a competition.

As a general rule, experience as a competitor is almost essential as a qualification for the single assessor, but in the case of a jury this experience may be dispensed with in some of its members if it is in other respects advantageous to have a wider field for selection.

To use the phrase quoted from César Daly, "the direction of architectural ideas" is subject to gradual change, and the pioneers of one generation become the exponents of the academic school in the next. In order, therefore, that vital fluctuations in our art shall receive due appreciation it is desirable that the adjudication of competitive designs shall not be entirely in the hands of the older and more experienced men, whose sympathies are liable to incline towards the earlier as against the newer methods. At the same time experience and mature judgment are invaluable, so that one of the chief recommendations of the jury system is the facility it affords for securing both the experience of the elder and the fresher point of view of the younger men.

Finally, we come to the compet when he has decided to compete, to master the programme, or con the document is more usually called the conditions include the program is the part essential to the prep the design. If the programme is w up it should at once give the co good general impression as to wha moters have in their mind; if it i competitor, by much reading and will gradually obtain, from acc phrasing here and there, some id points to which importance is attach a good programme no further should be needed, but with a bad competitor can help to patch it up of questions on salient points.

From the competitor's point of best programme is one that stat what is wanted but makes no atte dicate how these wants are to be pr As a rule, the allocation of the rel tions for the accommodation asked mistake, tending to hamper freedo conception of the design. If specia ments have to be met, it is far b these should be thoroughly explained attempt made to anticipate the co work by specifying some definite ment.

Holding the views I do with regs basis on which a competition shou cided, I must point out how rare double competition of advantage to t peting. The double competition ha where the promoters and their adv been unable completely to formu views, but almost its sole use is i before them a series of definite solu which they can realise how they h to grasp and express all that the mind. They are then able to suppl programme and secure a design mo approximating to their requirements is clearly recognised it disposes of ment for or against double competit promoters are obviously entitled to the problem is so complex that only of a double competition can the b be secured, but solely on the ground after seeing sketch solutions can all culties be realised. After all, one client has often to see two or thr sketches before he can fully explai The main difference is that the could usually clear up difficulties of and where they can the double c becomes unnecessary.

I ought not to omit a brief refere International Competition. Conside satisfaction has been felt with the many of these, and so long as there marked national distinctions, both tectural ideals and in the whole t the architect, it will be difficult to a It is all very well to regard art as a language, but if it is, the diale vastly, and no civilised people c developing a national form of expre be equally satisfied with any other fore each member of an internati will probably have an instinctive bia the work of his own countrymen, ever impartial each may desire to very difficult to arrive at unanimity, if the exhibits at a flower show mixed up and you were asked to de the finest flower amongst them. then we may find an architect tem ally qualified to adapt his ideas to environment, but except in such a unlikely that his work will be entire able in a country not his own.

Dover's New Mayor.

The Mayor of Dover for the ensu Councillor Richard John Barwick, is a local building contractor, and was 1921-22. His father was a builder but Mr. Barwick learnt his business wi Walter Lawrence & Sons, of Finsbu London.

OUR SCHEME COMPETITION: VESTIBULE DESIGNS.

nterprise of Messrs. Thomas Parsons & l merited the response attained by the con'est of colour schemes for the e treatment of the octagonal vestibule onnects their premises, 315 and 317, reet. For this purpose as many as gns were submitted. No doubt the f the occasion was largely due to the artistic talent furnished by the list of ors, who have this week awarded the 100 guineas, 50 guineas, 25 guineas, solation prizes of £10 10s. to five other ors. These assessors were Sir Edwin R.A.; Sir John Lavery, R.A.; Sir urray, R.A.; Mr. Frank Brangwyn, nd Mr. E. Guy Dawber, F.S.A. The d schemes are now on view in a room the vestibule. Visitors, therefore, can ir own opinion as to the suitability of ted proposal.

A. Cox, of 120, Adelaide-road, N.W. 3 is the winner. Each competitor was with a sheet of paper on which a perview of restricted size was in line drawn h had to be coloured to exhibit the deby this wise precaution all the competines are of uniform scale. The apartment corated is octagonal on plan with a aucer vault, and its position is on the at top of the main staircase, from he vestibule is entered under a fourrch. To the right and left are glazed ors, and in front a recess, also arched ile on the two splays are semi-circular ches, each side of the octagon having with a cornice running round, except e arch from the staircase is situated. is be understood that the architectural of the vestibule is rather busily consequently a broad simplicity of e treatment would appear to be the opriate method of solving the problem. the choice remains very much a f taste and individual preference. of the majority settled the award, derstand that the final result was not nanimous.

t and second premiated schemes differ in detail, except that both happen to oted the same principal variation due ing the pilasters and surrounds to the borways in black as well as those to e-backed recess, while the pilasters splay are in both designs finished in red. The continuity of the archimain mural features is thus ignored. singular that this partial treatment ve been chosen, instead of the more ous, not to say consistent, treatment In some other schemes, and notably 66, by Miss Violet L. Timms, who ngly uses vermilion red throughout. he point with the other the assessors decided in favour of Mr. Cox, and hey may be right. His domical ceiling ws, with arched ribs of gold broken by ell patternings (only partly shown), nd of clouds running round the saucer up its soffit. Over the niched arches l cartouche is introduced, shaded on the pendentive positions (so to speak) een central device surrounded by a , and gold scroll in a Baroque fashion g the shape, and these ribbons conir knotted frolicsomeness over the nd recess arches—rather detrimental uctural breadth where a plain surface be most needed. We suggest their and also, instead of the figure panel the recess where workmen are introsnewhat after the manner of Brangwyn), cent-glass illuminated transparency arched head might be an improvertificial light in any case will be The looking-glass proposed in No. 381 nd premiated scheme, by Mr. K. this same position would be objectionable because it would not only reflect the spectator, but also the staircase and windows beyond, thus increasing the restless effect of the whole thing. The apex of Mr. Cox's saucer dome consists of four circular bands in vermilion, from whence radiate seven tapering bands extending from a red disc in the middle and ending on a continuous fret of gold relieved by white, which also nicely separates the beforementioned bands. The floor is black with a yellow surround. We think this capable proposal could be simplified with advantage, and that the black treatment might be modified as already indicated.

The second premiated scheme, by Mr. K. Anna, 5A, Sinclair-gardens, W. 14, provides a much broader management of the ceiling, but his red radiating ribs, which assume an almost structural scale, diminish so rapidly as to reach vanishing point before they arrive at the top and mingle with the stencilled yellowish crown, where grey colour is introduced. These alizario crimson ribs have gold shells and trophies at their base. The black doors are picked out with grey, and the entablature and other mouldings are elaborated with frets in gold and red. Other ornaments are in green. Painted floral devices on the soffit of the dome occur over the niches. The floor is big in scale, with starlike patterning in grey and broken white, like marble in design, but probably to be executed in cork or linoleum.

Mr. A. W. Wall, Bonnington-crescent, Sherwood, Notts (No. 485) takes the third premium. His proposal is not shown to advantage, being so sketchily drawn, with a patchy effect. The pilasters and arches are to be carried out in yellows, ranging from burnt sienna to lemon chrome,, and partly in orange with a vermilion plinth as a contrast to the yellow upper part, where red is sparingly used for the architraves. A disconnected broad mural frieze in solid black rises above the springing line of the arches to the niches, in the splay, and ends at the bottom of the cornice. The doors are left brown, with white glass glazings. The floor is in dark green. The domical ribs of the ceiling are merely suggested by a slight difference of yellow. This in artificial light becomes uncertain to judge. The vermilion disc at apex of the dome is emphatic enough at all events.

The first consolation prize design (according to the hanging in the exhibition) is by Mr. E. R. Phillips (No. 225), of Plymouth. The idea is delicately conceived and nicely treated, if not conspicuous for effectiveness. The diapers on the pilaster bottom parts, in yellow and grey, with plinth mouldings in green and blue, are liable to appear trivial; the same enrichment is repeated under the caps. Figure panels, elaborately designed, are introduced on the three sides of the recess, but highly finished pictures seem rather out of place where the main purpose is intended to be, from the promoters' point of view, to obtain effect by fields of matt or glossy plain painting without relying on artists' panel pictures of figure compositions. A statue is placed in each niche to justify these paintings. Yellows of differing values for the vault and ribs are adopted, with sky-blue narrow bands as an edging to the ribs. The doors are of greenish drab like the panels below the pictures.

No. 366, before mentioned, is a masterly bold venture by Miss Timms, of Croydon, who has justified her strong red handling of the architectural structure by fillings of Oriental boldness (rather Chinese in detail), with green-stemmed fruit trees and odd Asiatic flowers distributed on a black background. These extend over the vault, the whole being set off by vermilion surrounds. This is quite the most striking design in the exhibition. The fact that the vestibule is always intended to be lighted by artificial light justifies this idea as contemplated by the competition conditions.

Mr. J. Morton-Sale, of Putney (No. 368), relies on monochrome, or rather a treatment of differing browns, with a glossy face, being skilfully managed. Dark bands emphasise the structural lines. At the summit of the ceiling the amber glass cone drop-light would give a glamour over this scheme and strengthen the horizontal lines by shadows, the top members of the cornice being painted in broken white to increase this effect of luminosity.

No. 463, by Mr. L. E. Robinson, of Bloomsbury, relies on whites with dark grey flutings in the pilasters (already small enough), and also used for the skirtings and fascias. Pale blue is employed for the arches and vaults.

Mr. F. R. Wilson, of Nottingham, is the last hung of the series of consolation prize works. He proposes matt paint, and treats his scheme with very delicate pickings-out, using frets frankly proportioned to a diminutive small interior. But dividing the pilasters into two horizontal spaces is a doubtful expedient. We prefer the bolder and broader handling adopted by Miss Timms (No. 366), and by Mr. Morton-Sale (No. 368). This, however, is at best a matter of taste.

In conclusion one remark seems pertinent, and it has reference to the manner in which Messrs. Parsons' façade, painted in oils three or four years ago has withstood the effects of London smoke and climatic conditions, although the front faces north, and so fails to obtain cleansing by the prevailing rains from the south and south-westerly aspects.

PREPARATION ROOM.

Additions to the Bland-Sutton Institute of Pathology, The Middlesex Hospital.

MR. ALNER W. HALL, F.R.I.B.A., Architect.

THE LIGHTING OF BUILDINGS.

THE second of a series of public lectures, at the Northern Polytechnic Institute, Holloway, N., was given on October 25 by Mr. Lawrence Tye, on "The Lighting of Buildings."

The lecturer dealt with recent developments in lighting and said that, as a science, it was essentially modern. Prior to 1883, when Auer Von Welsbach introduced the incandescent gas mantle, illumination was confined to the use of candles, oil lamps, and naked gas jets—all illuminants which have very definite limitations and obvious drawbacks. About the same date, interest was centred around Swan and Edison's introduction of the first electric glow lamps.

Owing to the recent introduction of efficient lighting and to its very rapid growth, it is easy to understand that a great deal of work has been carried out which is far short of a reasonable and attainable ideal. Reference was made to various sources of lighting available for country house lighting, such as acetylene, petrol air-gas, paraffin superheated lamps, and electrical plant, as well as to the familiar source of supply in towns, namely, electricity and gas from public mains. Acetylene is comparatively cheap to instal and very adaptable to artistic effects, such as for candelabras in oak banquet halls, &c. The cost of running is fairly high, and it is rather impracticable for cooking. Petrol air-gas is very suitable as an all-round medium—for light, heating, or cooking. Its initial cost is higher than acetylene, but cheaper as regards running costs.

Paraffin superheated lamps had a certain value for small schemes, whilst the self-contained electric plant had the advantage of convenience, cleanliness, &c., so far as lighting is concerned, but is, of course, impracticable for heating or cooking, owing to its relatively small output. Having referred to the sources of supply, wiring in wood casing, conduit (screwed and otherwise), and lead covered wiring was referred to, and samples of each type were exhibited.

Reference was then made to the scientific principles underlying sound lighting and to some of the laws which govern illumination. By means of a model, "Inverse Square" and "Co-sine Laws" were demonstrated; by this model, it could be seen that light varies inversely as the square of the distance from a given surface. For example, a surface, placed 1 ft. away from a light of 1 c.p., gave 1 ft. candle of illumination on such surface. If the distance was increased to 2 ft. it was seen how a surface four times the size received the same total quantity of light with a reduction in brilliancy to one-quarter of that received on the surface at 1 ft.; in other words, the intensity corresponds with the square of the distance divided into candlepower. The same model demonstrated the loss of brilliancy on inclined planes, *i.e.*, co-sine law, and gave other useful details.

The bare light source was next explained, and reference made to the small quantity of light which actually reached the working plane direct, the majority of the light being dependent upon reflection from walls, ceilings and other surfaces, which could not be more than 80 per cent. in the case of white surfaces and might be as low as 4 per cent. for deep chocolate and similar colours.

Diagrams were thrown upon the screen indicating the direction of light rays from various types of fittings and the value of opalescent, prismatic and other reflecting surfaces. The diagrams and photographs illustrating these fittings showed that to a large extent the direction of light can be controlled with exactitude, and that with proper knowledge the fittings could be adjusted to any required height or system of light distribution. A comparison was then made between direct, semi-indirect and indirect lighting, showing that approximately 50 per cent. more energy was required to get the same illumination intensity for a semi-indirect system and 100 per cent. more energy for an indirect system as compared with a direct system.

Illustrations were given of the lighting of shops and factories. In the case of factory lighting it was pointed out that the opaque reflectors, whilst giving the maximum value to light reflection, had the effect of creating a low head line owing to the density of the shadows in the upper part of the building, and that a certain amount of luminosity in the reflector had the advantage of lightening the appearance of the building as a whole and therefore creating a more comfortable apartment in which to work. The value of flood lighting was indicated, both from an architectural and an advertising point of view.

In closing, the lecturer invited closer co-operation between the architect and the illuminating engineer, and pointed out that, only by such collaboration, was it possible to secure correct illumination.

An interesting discussion followed, in which the principal speakers were Mr. William Woodward, F.R.I.B.A., F.S.I., and Mr. Keith Braden.

A vote of thanks was accorded Mr. Tye, on the proposition of Mr. T. P. Bennett, F.R.I.B.A., Hon. F.I.O.B.

The next lecture, on "Heating Systems Used in Buildings," will be delivered by Mr. F. Broadhurst Craig, M.B.I.H.V.E., on November 15.

INCORPORATED INSTITUTE OF BRITISH DECORATORS.

"EMPIRE STYLE IN DECORATION."

MR. FELIX DE JONG, President of the Incorporated Institute of British Decorators, read a paper at the Painters' Hall, Little Trinity-lane, E.C., on October 30, on "Empire Style in Decoration." The chair was occupied by Mr. L. Shuffrey (ex-President of the Institute), and among others present were Messrs. Stewart Greene, Drinkwater, Dakin, Anderson, and W. A. D. Englefield (Secretary).

Mr. De Jong said that as the Empire style had been revived a good deal lately he thought a general review of its origin might be of interest. Empire decoration was attributed to Percier and Fontaine, whose names had remained inseparable in the history of the art. They were known principally as architects, but they took as much interest in the interior decoration of their buildings as their exterior, and they might therefore compare them in their work to the Brothers Adam, as they also designed all the interior details, such as ceiling and wall decoration, furniture, fittings, carpets, hangings, so as to make the whole apartment, or interior, one harmonious scheme. Maurice Fouche told them in his biography of these two artists that the beginning of their career was a very laborious one, but after many early struggles their enterprises were ultimately favoured by the fashion of the day, which they were able to guide in the way of good taste and on a sound basis. Percier was born in Paris in 1764 and died in 1838. Fontaine was born in 1762 in Pontoise and died in 1853. His father was also an architect.

Mr. De Jong described some of the important works carried out by Percier and Fontaine in Paris, and pointed out that, although they engaged in the work of interior decoration, they still carried on as architects, and among their masterpieces was the Arc de Triomphe du Carousel. They carried out many important works of restoration for the Emperor Napoleon at Malmaison, the Palace of St. Cloud, and Fontainebleau and the Tuileries. Napoleon was very pleased with their work at his palaces and appointed them architects to the Louvre and other places. Napoleon spent large sums in the redecoration of the rooms at Fontainebleau and this work was executed by Percier and Fontaine, and the Salle du Trone and other rooms were still much admired. Percier and Fontaine were also engaged to d decorative and designing work in with the celebration of Napoleon which were on a very elaborate scale

Proceeding, Mr. De Jong said the the changes brought about at the eighteenth century in the forms o the furniture and the subjects of inte tion. Under Louis XV the general rounded and soft, graceful and l elbows light and delicate. After t revolution the forms were severe, t warm and even violent. This chan under the reign of Louis XVI, the subjects then under the Empire wer the furniture and decoration execu the revolution, such as the eagle and t It was, therefore, admitted that th style was only a continuation of the style. Percier and Fontaine were of the antique, but they were not an They considered that the classical f the purest, and their work was in these lines without absolutely copy but they looked at the antique mon men of the eighteenth century an archæologists. They were preoc much with their elegance as with th of the early ages. They considered interior decoration and furniture ar were so closely allied with constru architecture that they could not l the results with indifference. The r cover up the construction applied a furniture as to a building, and the ornamentation must be subservien architecture. This was the secret influence which these two artists have and the true origin of the perfect ada a style which they guided so well and they deserved to be called the creat

This style, after meeting with success all over Europe at the time of for about fifteen years, was afterw carded under Louis Philippe. It was harsh and stiff, lacking in grace and im The abuse of geometrical forms, the designs of monsters, chimeras, and th comfort in the furniture, all added to its ment. If some of their furniture or s considered too severe, or uncomforta must not forget that they were no made for rest or comfort, but that t made for the use of men of action, for re and other stately requirements. To Empire style was favoured again, but ised and adapted to up-to-date requi the forms and ornamentation were le the furniture, especially the seats, m fortable, and yet retaining the classica ance, the feeling and dignity so well in by Percier and Fontaine.

An excellent series of lantern sli shown, and Mr. De Jong described the ties of the Empire style in the furni decorations in the Emperor's rooms Trianon Palace, Versailles, and at Fonta

A hearty vote of thanks was accord close.

North Shields Building Trades' Assoc

Mr. George A. Leck (President) occu chair at a recent largely attended m the North Shields and Whitley Distri Building Trades' Association, held at Bay, when those present include Bertram, President of the Tyne and Federation; Mr. W. H. Hope, of Sun Secretary of the Northern Counties' Fed Mr. G. G. Carr, of Newcastle; Mr. J President of the South Shields Master Association; and Mr. Chas. Rowell, S of the local Association.

Mr. Carr, at the invitation of the N Counties' Federation, read a paper urg efforts be made in the district to strengt ranks of the Federation. They want members to realise what had been d them, and join. An address was also d by Mr. Hope.

THE HOUSING ACT.

THE DIRECT RELIEF OF THE WEEKLY TENANT.

By JAMES P. ORR.

he many people who are hard hit by evailing shortage of houses the great y have no chance of ever owning a The new Housing Act is devised to e the erection of new houses for both ner-occupier and the ordinary tenant. g the former out of consideration, I in this article to deal with the latter nd to show how the new Act can be to provide low-rented houses for the wage earner.

he present, at any rate, it will nowhere y to get the private builder to erect ouses in large numbers. A few are built by local authorities; but private s are engaged on houses of a larger re costly type for sale to people much off than the average weekly wage The policy underlying the grant of subsidy for houses built before Octo- 1925, with floor area between 500 and ft., is to make the early building of ouses attractive to private enterprise, local authorities my not have to build. end local authorities are empowered t private enterprise by grants and ad- from local funds, the Government king to contribute to these funds £6 um for twenty years for each house ed under an approved scheme before 1, 1925. To ensure that State funds unnecessarily drawn upon, section 2 s that local authorities may make only in accordance with proposals ap- by the Minister, and that, before his approval, the Minister must be l " that the need for such houses can- met without assistance under this

local authorities may prefer to do lding themselves, if they can do so at not far exceeding the subsidy the requires, because then, as owners of ses, they can fix prices and rents to al needs, and select as tenants the serving of those in need of relief from sing conditions. The Act, however, [sec. 1 (i) (*b*)] that the State con- n shall be granted in respect of houses local authorities only where the local ies satisfy the Minister " that the f their area can be more appropriately the provision of houses by the authori- mselves." All this is in strict ac- e with the declared Government policy lding subsidies as far as possible, and g the encouragement of private enter- the main feature in their programme aking good the shortage of houses. enterprise in any locality is sure to by of houses of a type which local ies are likely to build in large num- the near future, and let at less than c rents; so, for fear of discouraging enterprise, the building schemes of uthorities are not to be assisted by ment subsidies if local builders are o supply the houses needed with such ce as the Act permits; and, in any cal authorities are to get no more ce from Government than builders can

local authority's first step must, e, be to estimate the number of houses rent types demanded by local needs. are satisfied that private enterprise will, without intolerable delay, satisfy eds, there is nothing more to be done. think that provision of the required will be deferred too long, unless they they have to decide how far it is y to go in the way of (*a*) grants, der sec. 2 (*b*), or advances, etc., under in order to get private enterprise to local needs. It is clearly laid down in Circular 388a of the Ministry of Health that the local authorities must satisfy themselves that the assistance they propose to give is the minimum assistance required to induce private builders to erect the needed houses; so a local authority will not be permitted to pay a grant of £120 per annum if £90 per annum would be sufficient attraction to the builders.

In considering the capacity of private enterprise to supply local housing needs, the local authorities should, I submit, consider not merely the type of houses required and the number of each type, but also the time within which the houses can be built, and, above all, the rent at which they will be let. Local needs will not be met if the houses provided, though of the required types, are offered at rents which those in need of them cannot afford to pay; or to tenants who are not in really urgent need of relief from bad housing conditions, or who can afford a higher rent. It was suggested in Parliament that local authorities need not concern themselves about questions of rent or class of tenant, so long as houses of the right type were built, because, even if the rents were too high for the people in need of relief, these latter would find accommodation at a rent within their means in the quarters vacated by the new tenants. This assumes, however, that the new tenant is on the upward grade and hitherto has been paying a rent disproportionately low in comparison with his means, whereas more often in these days the new tenant will be on the downward grade seeking a lower rent more suitable to his purse than the high rent circumstances have hitherto compelled him to pay.

Small houses, especially those like most of the new ones with many up-to-date labour-saving arrangements, are in great demand; and it is well known that selection committees have had to exercise the greatest care to see that new houses erected by local authorities are reserved for those in most need of them. It can hardly be expected that a private owner of houses which have been unconditionally subsidised will select his tenants and fix his rents out of consideration for public needs; he is more likely to lay himself out to get the biggest possible rent. There may be some places in which, thanks to competition between builders, local authorities will have done all they need to if they secure the erection of a certain number of houses of the required type, leaving rents to settle themselves; but, in my opinion, if the benefit of the subsidy is, without undue delay, really to reach the people in most need of relief, the local authorities will, in nine cases out of ten, have to attach to the grant of a subsidy such conditions as to selection of tenants and restriction of rents as they would themselves observe if the houses were their own.

Outside the local authorities' housing estates a large proprtion of tenants of the class under consideration have hitherto been accommodated in houses erected by speculating builders financed by landowners. The builder worked on a few houses at a time and needed little capital to start with; he had plenty of clients, and as fast as he built he sold either to owner-occupiers or to small investors, immediately putting his enhanced capital into more new houses. But his clients have been hard hit by the Rent Restriction Acts; some of them have suffered from harsh administration of section 28 of the Housing Act of 1919, which gives local authorities power to enforce repairs of working-class dwellings, and most of them have learnt that there are safe openings for investment (*e.g.*, Savings Certificates) which offer far higher net profit and far less risk of worry than house property let to poor tenants. The speculating builder now finds his *clientèle* mainly among fairly well-to-do owner-occupiers. In the old days he did not mind being a landlord himself, pending sale of his houses; but he does not care to take such risks now; so his work does not help poor tenants and never will until the class of investors in small house property is resuscitated. The builder is ready to work for such investors, as soon as their orders come in, if they offer him at least the same rate of profit as he can get from owner-occupiers; he is not at all likely to come in in anticipation of orders. So far as he does not come in, the poorer tenants must do without new houses, unless local authorities themselves build them. If the local authorities wish to escape this by getting the private builder to satisfy the needs of the weekly wage earner, their part is to get him orders for small houses from investors at prices which will give him the profit he demands, and at the same time make it possible for the investor to reap a good profit from the rents which the weekly tenant can afford to pay.

The local authority will not be in a position to dictate to the builder what profit he must be content with; if he can get a certain rate of profit by building houses of a better type than the local authority is out to get, nothing less than a subsidy sufficient to give him that same rate of profit on the smaller houses will induce him to build them. No more can the local authority dictate to the investor what rate of profit he shall have. The investor will not come in until he can clearly see a permanently safe return at least equal to what he can get from other investments. The local authority will therefore have to determine the character and extent of the assistance they will give to the investor in consideration of (i) the rent which the people in need of relief can afford to pay, and (ii) the profit the builder and the investor demand. It would clearly be a misuse of the subsidy to grant it to a builder who sells or an investor who lets his house to people better off than those for whose relief it was given, in order to get something more than the profit he originally demanded; and yet in the absence of conditions binding the owner of the new house in regard to choice of tenants and amount of rent or price, it is pretty certain that in many places competition for new houses will defeat the object of the scheme: the wrong people will get the house, the builder will get more than the profit he bargained for, and the builder or owner, not the tenant, will get the benefit of the subsidy.

The local authorities' proposals as to grants, etc., under section 2 have to be submitted to the Minister of Health for approval, as also any conditions that the local authority propose to attach to advances, etc., under section 5. So, having decided what to do to help private enterprise and on what conditions, local authorities must next submit their proposals to the Minister of Health for approval. They will have to get to work very quickly, if the Minister's approval is to be obtained in time to allow of the completion of many houses before October 1, 1925. No cautious builder will start work before the Minister has definitely approved the local authority's proposals. It will often be necessary for the local authority to submit to the Minister of Health, along with their proposals for assisting private enterprise, proposals for building some, if not all, of the houses required for weekly wage earners themselves. Sometimes they may have to erect only a few houses, just to give private enterprise a lead. In cases in which all the inducements they are empowered to offer to private enterprise seem likely to produce at most something less than the full number of houses required before October 1, 1925, they will have to decide whether to embark on a scheme for erecting the balance themselves; or, again, in cases in which investors will not accept restrictions as to rents, etc., which the local authority think necessary conditions of assistance, the local authority may have to take the whole burden on themselves. In such cases it will surely be clear enough that the houses can " more appro-

priately" (section 1 (i) (*b*)) be provided by the local authorities, if no greater loss to the public purse is involved than the assistance demanded by private enterprise would entail.

There is nothing in the Act to prevent local authorities from building along with private builders. The Minister of Health declared in Parliament that he hoped to see both local authorities' schemes and private schemes in progress together, and section 1 (i) (*b*) expressly provides for the case in which the required houses will be provided *partly* by the local authority themselves. Let us take, in illustration of the local council's procedure, a simple case in which the housing survey has shown that 300 new houses of the subsidisable type are required by weekly tenants at present ill-housed. Possible sites have first to be found for these 300 houses; and for purposes of supervision and control it will be desirable to have large compact residential estates rather than many widely-scattered little groups of houses. Large new residential estates have the great advantage that they are self-protected against intrusion of factories, shops, etc. The council will probably do well to acquire the necessary land and help investors by letting them have their house sites on 999 years' leases at low ground rents just sufficient to cover debt charges on cost of acquisition and development of roads, sewers, etc. This will considerably reduce the capital the investor must raise, and at the same time will ensure that the lay-out and number of houses per acre are as determined by the council. Moreover, the council, as ground landlords, will be in a strong position for enforcing as terms of the proposed lease any conditions they may attach to the assistance they give—*e.g.*, conditions limiting rent for five or six years or so long as there is great shortage of houses, or conditions requiring the landlords to select their tenants from the council's panel of approved tenants of small means during that same period. The council may give their assistance wholly or partly in the shape of remission of ground rent for a term of years. The substitution of a peppercorn rent for a 999 years' rent just sufficient to cover cost of land and development would, according to the calculations on which the State grant of £6 per house was based, be equivalent to a lump-sum grant of £70.

What the council have to consider is how, with the least possible delay, and with (but, if necessary, without) the aid of private enterprise, to get for those in need houses suitable to their needs at rents within their means; so, whether they themselves provide sites or not, the next question after the location of sites has been determined is, "What rent can the tenants afford to pay?" and the answer must be given in consideration not merely of present conditions but of the prospects of at least the next sixty years; for the investor in houses has to think out his finance for the whole life of the house, and the council have to follow the same lines as the private investor, since they know that if he will not build they must. Many of the tenants are probably paying more than they can really afford—rents agreed to when wages were abnormally high and houses abnormally scarce, and when there seemed to be some prospect of the shortage being soon made good. On the other hand, it may in some districts be possible to forecast a permanent rise in wages above pre-war normal when the present trade depression is past.

If the council mean to prevent overcrowding and wish to see each house occupied by a single family only, they may do well to aim at average rents (inclusive of rates) which will not absorb more than one-fifth of the average family wages obtainable when local trade conditions are normal. Suppose they decide, on these or other considerations, that there must be 100 houses at 10s., 100 at 8s., and 100 at 6s. rent per week, exclusive of rates; their next step should be to calculate the maximum price at which these houses must be made available in order to attract the investor. If the council themselves were the investor they might be content to do without any profit, and to get a return on the capital cost just sufficient to pay maintenance charges and debt charges, say, 6 per cent.; but few private investors will be content with less than 8 per cent. on their capital, so that the houses rented at 10s., 8s., and 6s. per week must not cost the investor more than £325, £260, and £195 respectively. The Government grant is equivalent to a lump-sum payment of £75; so if the council bear the cost of the developed site and get contractors to erect for investors houses at least as attractive as those which in normal times fetch 10s., 8s., and 6s. net per week at a constructional cost of £400, £335, and £270 respectively, the investors will on receipt of the Government subsidy be in a position to make 8 per cent. on their investment, even though they are bound to limit their rent to 10s., 8s., and 6s. per week for five years, and to select their tenants from the council's nominees, as proposed above. Thus, and thus only, so far as I can see, will the council through private enterprise secure direct relief for weekly tenants now ill-housed.

If builders hold out for more than the above prices or investors for more than 8 per cent., it will be open to the council (i) to increase their grant above the £70 represented by remission of ground rent and/or (ii) to build departmentally, either through contractors or by direct labour, so as to give tenants the benefit of the reduction in rent which should result from the reduction of the 8 per cent. required by the investor to the 6 per cent. which the council can do with. There are, however, many pitfalls about departmental building; it does not always reduce cost. I would always limit it to a small section of the scheme at any one time; so that there may be a *locus penitentiae* for builders and investors, and they may settle their differences and come in later on other sections of the scheme with, perhaps, the aid of an increased grant from the council. The knowledge that there is a time limit for the grant may help them to settle their differences quickly. The time limit applies equally to departmental building; so the council cannot afford to postpone their scheme pending negotiation with builders or investors. Some 240 councils have already been permitted to start their own schemes for making good part of the local shortage of houses; 28 of these and 89 others are getting builders to work on approved private schemes, aided by grants varying from £50 to £150 (but mostly £100) per house.

Bristol, Swindon, Hale, and Bromley are among the councils who have made their assistance conditional on restriction of rents. The weekly rents are limited to 7s. 3d. in Swindon (185 houses) and 9s. in Bromley (100 houses). In Hale the rents are limited for five years to 8 per cent. of actual cost. Swindon and Bromley are both giving assistance in the shape of a lump-sum grant of £75 per house, while Hale gives an annual grant of £6 per house per annum.

Winchester House.

Winchester House, St. James's-square, has been sold by the Office of Works, for approximately £100,000, and it is to be converted into a club. The property was acquired nearly fifty years ago by the Crown at a cost of £45,000, having been before that the London house of the See of Winchester.

The house has been used for Royal Commissions and a variety of official purposes.

Messrs. Foord & Salberg were the agents for the Office of Works, for whom also they acted in the sales of the Windsor Hotel, Victoria-street, and the Wellington Hotel, Buckingham-gate. Messrs. Mellersh & Harding are the agents for the purchasers of Winchester House, which will, it is understood, become the Centaur Club. The sale follows closely upon that of Lord Falmouth's mansion in St. James's-square to an insurance company, and other changes in the square are impending.

THE WONDERS O BABYLON.

SIR BANISTER FLETCHER, in his lectu Wednesday, October 24, on Babylonian, As and Persian architecture, said that the tecture of Mesopotamia differed much fro Egyptian in character, for it was vaulte not trabeated, as was inevitable in an al country which supplied clay for the maki bricks to be used in vaults, but no stone fo beams. In Assyria, too, there were n tombs nor temples, but chiefly kings' pal whereas, among the temples and tom Egypt, we may well ask, "Where di Pharaohs live?" This, however, does not to the Babylonian period, which began at remote time in the dim dawn of the worl lasted till, say, 1275 B.C. This was the te building epoch, when every city of the deans had its "ziggurat," or "holy mount a pyramidal observatory-tower with a decorated temple chamber on the summit, which the astrologer-priest could study heavenly bodies. The temple at Nimrou erected in seven receding terraces, each dedi to a planet and decorated symbolically in g bricks of a different colour.

Recent German excavations at Babylon discovered ground plans, marked out by aspl of the Temple of Baal, and of numberless towers, none of which, however, correspo the popular pictures of the Tower of B The attempts to build a tower which sh "reach to Heaven" are very simply expl by the desire of the Babylonians to breal monotony of their flat and dreary cou The excavators also discovered signs of irrig suggesting the site of the hanging garde Nebuchadnezzar. Then came the Assyria palace-building period (about 1275-538 The tremendous palaces of the Assyrian were the dominating features in the valle the twin rivers Tigris and Euphrates. stream of human life flows on, and we can as elsewhere, judge its nature from its a tecture. Kings' palaces and walled cities raised on mighty mounds or platforms by g of slaves who lived and toiled in the mir plain below. The buildings and decora reflect in a remarkable degree the natu the country and the building material it supp as well as the social and political conditio that age—the dominance of the war-like and the subservience of the bond people. Bible story of the Babylonian captivity testimony to the position of Assyria as the War Power of Western Asia.

The perishable brick material necessitate the absence of stone is largely responsibl the disappearance of the buildings, for it mostly returned to its original clay, leavin fine alabaster slabs, in which there is no re of religious rites, but all is devoted to wa the chase. There was naturally surface de tion instead of mouldings, massive walls in of columns and vaults instead of flat r British excavations at Khorsabad have rev the plan of the town and of the Palace of Sa twenty-five acres in extent, with its long na apartments suitable for roofing by brick ar The Greeks may have got their palmette rosette and colour decoration from Ass sources, as also the scroll or volute. Here was discovered, in the water channels, the of the pointed arch; while a relief records use of the dome, familiar in Byzantine v centuries later. Is there in architecture anyt new under the sun? Sir Banister conclude an interesting account of the Persian ar Susa and Persepolis, and the Tabernacle Solomon's Temple at Jerusalem.

The next lecture will deal with the architecture of Crete and Mycenæ.

Excellent illustrations of their "Wel struct" patent slotted steel appliance racks, bins, benches, shelving, show stands, & are contained in an attractive booklet issued by the makers, Constructors, Ltd. 4, Brook-street, St. Paul's, Birmingham.

THE BUILDING TRADE.

BUILDER'S IMPRESSIONS OF THE UNITED STATES.

By EDWARD J. STRANGE (*Past President, Institute of Builders*).

E setting out upon a journey of 13,000
e writer was informed that from a
standpoint nothing could be learned
Inited States of America, but on the
much of interest was found in the
architectural types of public and
buildings, in their arrangements and
fittings, and in the methods em-
in their construction. The labour
as compared with that in our own
would alone have made the journey
rth while.

ublic buildings are exceptionally fine,
tion only two—the Pan-American
Building and the post-war Abraham
Memorial at Washington, D.C. The
Cemetery, constructed in the grounds
ral Lee's home at Arlington, is well
d. The auditorium from which the
oration is delivered, facing an open
eated amphitheatre capable of accom-
g 1,500 persons, is evidence of the
shown to those who gave their lives
ational cause, and there is much indi-
here and elsewhere of the Govern-
desire to make American citizens of
ople of various nationalities who find
me in the United States. The
or Parliament buildings, of the
States are usually of classic design
e proportions.

city's fire-zone wood is the principal material used in construction, and the usual design is well known. Basements for storage and central heating are usual: the former is required by by-laws, and the latter is found in quite small dwellings.

The writer was told that in the suburbs of large towns in Massachusetts (and given to understand this generally applied) building land is not leased but sold outright, not at so much per ft. frontage, but at per ft. sup. The price varies from 5 cents upwards. Upon one estate in the suburbs of Boston the plots were 50 ft. by 100 ft. at 10 cents per ft. sup., or about £2 a ft. frontage in our money.

In opening new building estates (and there is considerable activity everywhere) the lay-out is carefully planned, roads and drainage constructed before building operations are commenced, and the estate (according to the informant) bears half the cost and the local authorities the other half.

In civic buildings the cities appear to vie with one another in their efforts to improve their beauties and amenities. St. Louis, Missouri, has recently raised a bond of 87 million dollars, of which 20 million dollars (£4,000,000) are for street improvements and a new town hall.

The city of Chicago is taking in a large section of water to form a lake-side drive of extensive area, linking up the public gardens which abound in that city. Piles have been driven in the lake and large-bore silt pumps are at work, not pumping the water from the reclaimed area into the lake, but the reverse. This water is full of sand in suspension, which precipitates the water gravitating back into the lake.

Mr. A. G. White (Secretary of the National Federation of Building Trades Employers) gave the writer an introduction to the Secretary of the Federated Building Trades Employers in New York City, who stated that with the high wages now paid there was an increasing insufficiency of good craftsmanship. Apparently the workmen in that city auction out their labour to the highest bidder, and the employers do not co-operate to prevent it. Plasterers are the most highly paid craft, receiving $16 to $19 per 8-hour day. It was stated that something must be done to relieve the situation, or the public would some day intervene. The New York *Times* of June 21 last stated:—"Builders who have taken to erecting structures during the winter rather than in the usual season said that the increased wage to bricklayers would have no immediate effect on them, as the efficiency of bricklayers to-day was less than two-thirds of their efficiency during the winter. Last winter these contractors paid $10 a day and obtained full efficiency from their men." And further, "The interests that have been studying the American plan of open shop and a more open apprenticeship system, with the New York building trades in mind, are of the opinion that unless the public takes a firm hand rents cannot come down."

The supply of skilled labour in the building industry is understood to be a grave problem. It was the writer's good fortune to learn in conversation with an architect of New Orleans, and also with a New York city architect, that the employers and operatives, realising that the absence of unrestricted immigration necessitated the tackling of the means by which skilled craftsmen could be obtained, had formed Joint Councils, represented by equal members of both employers and employed, with three neutral representatives of the professional side. In this apprenticeship scheme the wages were a percentage of the craftsman's rate, starting at 30 per cent. and only increased at six-monthly intervals according to a test carried out by members of the Joint Board, aided by the technical school officials—the apprentices learning "how" on the jobs and "why" in the schools.

In New York City the electrical engineering trades' employers and operatives had, at their joint expense, opened an Employment Bureau with whole-time secretary, and all men were engaged through this Bureau, with excellent results. The effect upon the morale of the men was stated to be remarkable, reducing "ca' canny" methods to a minimum.

In view of the inquiries now being prosecuted by the Institute of Builders upon the best means of recruiting the best brains of the country for the future employers in the industry, and investigating the possibilities of the better training and equipment of the master builder, the following may be of interest:—

Courses in building construction have been established at Yale University and Union College. The Thompson-Starrett Company offers to provide two annual prizes of $2,500 each, to be awarded each year to graduates of the course who shall commend themselves by the quality of their work and by their promise as practical building constructors, and who desire to connect themselves with the Thompson-Starrett Company for practical training in their chosen calling.

The course in building construction is to be offered as a development of the civil engineering course, rather than an appendage to a course in architecture. This move is made upon the theory that building construction is looked upon more as a profession in itself than subordinate to architecture. In proposing the establishment of such a course and undertaking to support it, the purpose in view was to supply a number of technically-trained and educated men to perfect the capacity and work of the constructor, with the hope that building construction would become a profession as dignified as architecture, and on a parity with it.

In conclusion, the writer's impressions upon some of the subjects dealt with in this article may be summed up as follows: The development of a new country is obviously helpful to a student in the old country, and that social and industrial problems are world-wide, and the interchange of thought between men of different nations tends to a better understanding and possible solutions.

The Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have made the following awards in respect of selected engineering papers published without discussion during the Session, 1922–1923:—

A Watt medal to Mr. T. E. Houghton, M.Eng., Assoc.M.Inst.C.E. (Liverpool), and Telford premiums to Mr. J. W. Meares, C.I.E., M.Inst.C.E. (Guildford); Mr. J. W. Spiller, M.Inst.C.E. (Maidenhead); and Messrs. G. S. Coleman, D.Sc., Assoc.M.Inst.C.E. (Manchester), and Dempster Smith, M.B.E., M.Sc., Tech. (Manchester), and in respect of papers read before meetings of Students of the Institution in London and the provinces during the same period:—

Miller prizes to Mr. E. L. Everatt, Stud.Inst. C.E. (Newcastle); Mr. J. G. Kimber, Stud.Inst. C.E. (London); Mr. A. H. Naylow, M.Sc., Stud.Inst.C.E. (London); Mr. E. Sykes (Birmingham), and Mr. F. J. Symonds, Stud.Inst. C.E. (London).

THE RENT ACT: POSSESSION.

A paragraph in *The Times* of November 16 referred to a case in which the Judge at one of the county courts in Essex is reported as having said, in refusing an application for possession, that he desired to take this opportunity of making known the method he intended to adopt in such cases, and he then went on to say it seemed to be forgotten that section 5, subsection (1) of the Rent Act, concluded with these words: "And in any case as aforesaid the Court considers it reasonable to make such an order or to give such a judgment," and he described the Act as an involved and confusing piece of legislation. The learned Judge then is reported as having said that he should continue to look at all the circumstances of the case, the circumstances of the tenant as well as those of the landlord, until a higher Court told him to do otherwise. The circumstances of this case are not given in the paragraph in question, but we may make one or two general observations on the legislation.

In the first place, section 5 of the Act of 1920 is no longer operative, as it has been superseded by section 4 of the Rent and Mortgage Interest Restrictions Act, 1923. The amendments introduced into section 5 were so complicated that the Legislature took the wise course of redrafting the whole section, and thus incorporating the amendments, and it may serve a useful purpose to consider them. The words quoted by the Judge do not appear at the end of subsection (1), but at the end of the first nine paragraphs. The section begins: "No order or judgment for the recovery of a dwelling-house to which this Act applies or for the ejectment of a tenant therefrom shall be made or given unless"—then follow the paragraphs we shall notice in a moment—"and in any such case as aforesaid the Court considers it reasonable to make such an order or to give such judgment." The whole of the following paragraphs are, as the Judge pointed out, governed by these words conferring a general discretion, and subject to this discretion they indicate the conditions which must exist to obtain an order for possession.

Paragraph (*a*) is unchanged and stands as in the Act of 1920; rent lawfully due must have not been paid or some other obligation of the tenancy, whether under the contract of tenancy or under the Rent Acts, must have been broken or not performed.

Paragraph (*b*) refers to the user of the premises, and so far as this user is concerned, that is conduct which is a nuisance or immoral, and acts of waste, the paragraph is unaltered, but there is an addition. The Act of 1920 only referred to the "tenant or any person residing with him," but the new Act amplifies this, and also includes any person "lodging with him or being his subtenant," and the following words have been added at the end of the paragraph: "And where such person is a lodger or subtenant the Court is satisfied that the tenant has not, before the making or giving of the order or judgment, taken such steps as he ought reasonably to have taken for the removal of the lodger or subtenant."

Paragraph (*c*) is unaltered. It refers to cases where a tenant has given notice to quit and, acting on that notice, the landlord has contracted to sell or let the premises, and may be prejudiced if he cannot obtain possession.

Paragraph (*d*) has been considerably amended and extended, and the nature of the alternative accommodation has been more closely defined. We set out the paragraph, italicising the words contained in the paragraph as it stood in the Act of 1920: "The dwelling-house is reasonably required by the landlord *for occupation as a residence for himself*, or for any son or daughter of his over 18 years of age, or for any person bona fide residing with him" (the Act of 1920 also said, 'or to reside') "or for some person engaged in his whole time employment or in the whole time employment of some tenant from him or with whom conditional on housing accommodation being provided a contract for such employment has been entered into and except as otherwise provided by this subsection) the Court is satisfied that alternative accommodation is available which is reasonably suitable to the means of the tenant and to the needs of the tenant and his family as regards extent character and proximity to place of work, and which consists either of a dwelling-house to which this Act applies, or of premises to be let as a separate dwelling on terms which will afford to the tenant security of tenure reasonably equivalent to the security afforded by this Act in the case of a dwelling-house to which this Act applies." In the Act of 1920 it was only provided that the alternative accommodation should be "reasonably equivalent as regards rent and suitability in all respects."

Paragraph (*e*) has been redrafted: "The dwelling-house is reasonably required for the purpose of the execution of the statutory duties or powers of a local authority or statutory undertaking or for any purpose which, in the opinion of the Court is in the public interest, and the Court in either case is satisfied as aforesaid as respects alternative accommodation." Paragraph (*f*) is unaltered. It refers to landlords who became landlords after service in the war and require the house for personal occupation, and offer the tenant accommodation in the same house. Paragraph (*g*) is also unaltered, and refers to tenants who gave up occupation for service in the war. Paragraph (*h*) is new. "The tenant without the consent of the landlord has at any time after July 31, 1923, assigned or sublet the whole of the dwelling-house or sublet part of the dwelling-house, the remainder already being sublet." Paragraph (*i*) is also new, referring to licensed premises where an offence or improper conduct of the premises is proved.

Now, on consideration of all these paragraphs, it will be apparent that, with the exception of paragraphs (*g*) and (*h*), quite apart from the general words which follow them as to a judicial discretion, from the very nature of the subject matter a judicial discretion is involved. In the case of breaches of contract such as defined in paragraph (*a*) that discretion must be a "judicial discretion," that is, a discretion based on lines defined by the law; for instance, in case of breach of covenant the Court would presumably consider the legal grounds on which relief is given. In paragraph (*b*) there are three grounds for the discretion of the Court—the degree of annoyance, the deterioration of the premises, and lastly the conduct of the tenant as regards the subtenant or lodger. In paragraph (*c*) there is a discretion as to whether the landlord has been prejudiced by the notice to quit. In paragraph (*d*) there is a discretion as to whether the house is reasonably required by the landlord, and as to the sufficiency of the alternative accommodation. In paragraph (*e*) the Court has to be satisfied that the house is reasonably required for the statutory purpose, or for a purpose which is for the public interest as well as to the alternative accommodation.

In paragraph (*f*) the discretion has to be exercised as to whether the accommodation offered by the landlord who has served with the Forces in the same house is reasonably sufficient. So far in each paragraph there are specific questions upon which the Court must exercise a discretion, but the next two paragraphs are somewhat different. In paragraph (*g*), which relates to a former tenant requiring the house of which he gave up the occupation to serve with the Forces, there is no qualification as to the claim being reasonable, and in paragraph (*h*) the letting, assigning or subletting without consent appears an absolute ground for possession. In these two cases there is no special point for discretion, and if the general words at the end of these paragraphs confer a discretion it must be a general discretion based, for instance, on the conduct of the parties in the matter, and such a general discretion can also be exercised presumably in relation to the subject matter of the other paragraphs, unless it can be argued that the general words "and in any such case as aforesaid, the Court considers it reasonable to make such order or give such judgment" means such case as aforesaid where a discr to be exercised under the several p the Court considers it reasonable to m order," an argument which seems fa Whilst we are considering this first s of section 4, and the amendments i into the Act of 1920, it may be use complete the survey by showing the introduced in the remaining paragrap relate to cases in which the existence native accommodation is not to be a of an order or judgment for possessi

Paragraph (*i*) is unchanged. It r cases where the tenant was in the em of the landlord, or of a former land the dwelling-house was let to him in co of that employment, and he has left th ment. Paragraph (*ii*) relates to cas the Court is satisfied by the certifica County Agricultural Committee, or Minister of Agriculture, pending the of a committee, that the dwelling required by the landlord for occupat person engaged in work necessary for t working of an agricultural holding, a present Act the following words h added: "or with whom conditional o accommodation being provided a co such work has been entered into graph (*iii*) has been unaltered, but question arises in connection with it. "Where the landlord gave up the o of the dwelling-house in consequenc service in any of His Majesty's Forc the war." Now this paragraph is no paragraphs in the earlier part of the su an operative paragraph stating the gr which possession may be claimed, bu paragraph dispensing with the con alternative accommodation, and whe to the operative paragraphs it appears case is not there dealt with. Paragrap deals with a landlord who became the after service, and paragraph (*g*) rel tenant who gave up occupation of the to serve, but the case of a landlord up occupation to serve appears omit any operative paragraph.

Paragraphs (*iv*) and (*v*) are entirely to the corresponding paragraph in t 1920 and, therefore, they should be noted. These two paragraphs no (*iv*) "Where the landlord or the hu wife of the landlord became the landl June 30, 1922, and the dwelling-house ably required by him for occupat residence for himself or for any son or of his over 18 years of age"; or (*v*) " landlord or husband or wife of the lan not become the landlord before June and the dwelling-house is reasonably by him for occupation as a residence f or for any son or daughter of his ove of age, and the Court is satisfied th hardship would be caused by refusing an order or judgment than by grant

Thus the existence of alternative a dation is dispensed with in both th but where the landlord has only acq house after June 30, 1922, an ex extended discretion is conferred on t for the order can only be made if th satisfied that the scale of hardship tip the side of the landlord. It will be subsection has been so extensively that the corresponding subsection in t 1920 is practically superseded, and portant that the provisions of the new be understood. This is one of the portant subsections in the Act, and therefore, endeavoured to explain wh changes in the law under the present Ac

Building Collapse.

A number of men were injured, five as the result of the collapse of roof an in a building in course of erection as sion to an existing large building in K Kilburn. The old building, formerly store, situated at the corner of High Birchington-street, is being reconstr Messrs. Woolworth & Co.

TRAINING IN THE PAINTING AND DECORATING CRAFT.

By A Fellow of the Institute of British Decorators.

question is sometimes asked as to what edge is essential that one may practise aft of the painter and decorator. When estion is extended and its scope applied person engaged in conducting a business ecorator, or the decorating department of ll business run under the general title of ler and Decorator," one can only answer : should learn the trade or craft as thor- as it is possible, and not until you have his are you really well qualified to accept structions from your client and advise this very complex business." "As ghly as possible" may appear vague, need not be so; it can become very e if one is reminded of the display of ecently set out at the Decorators' Exhibi- Holland Park.

n it one saw that the range of sub-division nsive—so great that one requires very rable practise in each section—and ust involve some years of hard work.

the apprenticeship system as it is, it is know the fact that there is to-day a very scheme of education by means of which ployer of the future may receive the ry training, and go on step by step from ly stages, through the various grades of petition held by the National Federation ter Decorators, to the examination by y and Guilds of London Institute, on Advisory Committee the Federation is y represented. Following this there are reliminary, Intermediate, and Final ations for admission as an Associate ow of the Institute of British Decorators. is scheme in its entirety is comparatively would be unreasonable to insist that no should practise unless thus qualified; time may not be far distant when we pect the same kind of "hall-mark" of y from the person practising the business building craft as we expect from the the dentist, lawyer, or solicitor.

odern practise of the craft one finds re many things done in a vastly different an they were a quarter of a century ago. velopment of the value of materials, in function of which is mere obliteration, ; one has come to accept as right partly d materials, paints in semi-paste form, n, we are told, ready for use. These need a different understanding from ich was sufficient when we were limited tically one pigment for a base for all lours. The use of lead requires a fresh anding if we are to use it to its best ge. If limits are to be imposed upon we shall need still further to find how use the proportion allowed to meet the f treating our surfaces with a good -resisting material. At the present t does not appear at all certain that strictions are a necessity, except, perhaps, rd to the method of working. Much done by better methods and a more understanding of what personal hygiene

method usually observed amongst good en of preparing surfaces for repainting lly changing through the introduction satisfactory materials, but much preju- nds in the way of development, though ld always be efficiency that counts; his is to be so one can reasonably predict of pumice-stone as a material suitable paring surfaces that have been previously

r the new process much of the dust and ociated with repainting will vanish, and mbers of the craft will be more welcome ntering the household of clients. Even ocess of removal of old wall papers by ally applying water with a brush and ng the saturated paper with a broad knife seems to be doomed, for there is another method which, no doubt, will soon come into more general use.

All the foregoing should serve to show that the study of painting and decorating is one that requires careful thought and conscientious application. The practise of it by an employer should be an indication that one is a master craftsman and as such should be able to deal with all the many difficulties of the client, be he architect or householder. There is now no difficulty in acquiring the knowledge. We have schools where there are special departments for training, not only painters and decorators but persons for all the other building crafts. The opinion that anyone can do painting is borne of ignorance and stupidity, frequently coupled with an exalted idea of one's personal capability, accentuated by a lack of intelligent understanding of anything except the absolutely obvious.

A daily paper recently published an article headed "Our Disappearing Craftsmen." Bearing in mind the very recent Decorators' Exhibition and the display of excellent work by young craftsmen, one could write on the "re-appearing craftsmen." If there is a shortage—as there does appear to be—are not the employers and clients of the past as much to blame as anyone? How often we hear on the job and in the workshop that the work has been cut for price and told it is near enough? If we are to go on doing things that are only near enough, then we shall not be able to encourage sound craftsmanship either amongst the decorator or any other section. If the job is cut for price it should not be cut for method..

Much can be done by sound business organisation and intelligent use of both material and labour. Let labour be used a little less as the scapegoat, and let painting be a little less the Cinderella of the Building Industry. The craft is becoming so well organised educationally that it will be found that Cinderella will surely go to the Ball and hope to find colleagues of the other crafts there too.

A building trade official is reported to have said that local builders are absorbing the bricklayers and paying them higher rates than the Federation members are allowed to pay. He says the remedy is to train more apprentices. This may be equally true of painting and decorating. We need to train apprentices, but what is the use when there is so much difficulty in getting employers to accept them. A batch of about twenty-four apprentices was recently offered to employers in one area, and not one acknowledged the letters written; needless to say, the boys were quickly snapped up by the non-federated employers. If they can pay the rates fixed by the most active of the federated sections what is the difficulty? It appears that they want the labour only when it is a first-class dividend earning factor; if they are interested in the profits of to-morrow they must of necessity shoulder the responsibility of the training of the journeyman and employer of to-morrow. It is now more necessary than ever that employers should put their house in order and boldly accept the inevitable. If we can correctly talk of "Disappearing Craftsmen," let it not be said there is a shortage of employers who are prepared to accept apprentices. There is no reason why an apprentice should not be paid an adequate wage to meet present conditions. Decorators' Federation have agreed to a scale of wages that should encourage any boy who desires to enter the craft. Not only does he receive a good and reasonable remuneration, but also an opportunity of receiving definite and progressive instruction, and the scheme is embraced by both operative and employer. If will go far to provide the employer in even a small way of business with suitable craftsmen.

THE NATIONAL ASSOCIATION OF WATER USERS.

At a largely-attended and representative gathering at the Connaught Rooms, Great Queen-street, W.C., on Wednesday last week, it was resolved to form "The National Association of Water Users." Mr. T. A. McIntyre (Shanks & Co.), presided.

The Chairman explained that they had met that afternoon to receive the report of the committee appointed to draft the constitution of the Association.

The report of this committee, which, after amendments, was adopted, was as follows:—

The Association to consist of such consumers of water, manufacturers of water fittings, manufacturers of water pipes, builders and builders' merchants, property owners, sanitary authorities, architects, plumbers, hot-water engineers, and others interested as shall from time to time be elected or re-elected with the following objects:—

To scrutinise all applications by water authorities or associations for statutory powers to make or enforce regulations and to take steps to prevent powers being granted which in the opinion of the Association are unnecessary or undesirable; to oppose all attempts on the part of the water authorities or associations to use unduly or to increase unduly their existing powers; to scrutinise, and, if found desirable, oppose all attempts on the part of water authorities or associations to impose any standard specification of water pipes and/or fittings to the exclusion of all other pipes and fittings which are sound, suitable and efficient; to procure the modification of any existing powers and/or regulations which are or may become onerous and unduly exacting and tend to increase the cost of building; to promote legislation or to take such other steps in connection therewith as the Council may decide; to assist members with advice on all questions between them and water authorities or associations and if so resolved by the Association to act on behalf of such members; to collect and collate evidence relating to the activities of water authorities or associations in any matter affecting water consumers; to inform members from time to time of legal decisions or of efforts to resist any attempts to enforce regulations or "requirements" which have no force; to interchange information and to co-operate with other societies and associations in furthering the objects of the Association; to do all such other acts as the Council may consider necessary or expedient in the interests of the members of the Association, and other consumers of water; that the Association be named "The National Association of Water Users"; that the association be controlled by a council consisting of a President and three Vice-Presidents (*ex officio*) and other members to be elected in general meeting; at least ten or other sufficient number of the places on the Council should be reserved for the nominated members of each separate and distinct interest among the members of the Association; the subscription of ordinary members (firms or individuals) to be not less than £2 2s. per annum. Institutes and associations applying as such for membership to be admitted on such terms as the Council shall from time to time decide.

During the general discussion on the report of the Drafting Committee, Mr. F. W. Davy, B.A., who acted as secretary, said they wanted to get in the Association the best expert opinion possible in regard to every section of interests concerned.

The Chairman referred to the attempts of water authorities to impose standard specifications in relation to water fittings, and pointed out how the Association would oppose such claims. Some water authorities claimed to have such powers, he said, but some also had no right to make such a demand.

The following members were appointed to the Council, with power to add to their number:

E. Barber (Messrs. E. Barber & Co.), E. J. Brown (London Master Builders' Association), J. F. Carlile (Messrs. W. N. Froy & Sons, Ltd.), S. F. Corby (Messrs. Doulton & Co., Ltd.), W. H. Eason (Messrs. John Bolding & Son, Ltd.); P. M. Fraser (Royal Institute of British Architects), H. Falkner (Builders' Materials Central Committee), A. Gray (The National Association of Master Heating and Domestic Engineers), G. Gummer (Messrs. Gummers, Ltd., Rotherham), R. H. Hellyer (Messrs. Dent & Hellyer, Ltd.), A. Jones (Messrs. Tylors (Water & Sanitary), Ltd.), F. Love (Messrs. Frank Love, Ltd.), T. A. McIntyre (Messrs. Shanks & Co., Ltd.), A. Moore (Improved Industrial Dwellings Co., Ltd.), A. Mousley (Messrs. Charles Winn & Co., Ltd., Birmingham), H. R. Selley (Property Owners' Association and Federation of House Builders), J. C. Smith (Associated Master Plumbers), T. A. Wheatley (Messrs. Beck & Co., Ltd.).

Mr. T. A. McIntyre was unanimously elected President.

The question of the appointment of a secretary was referred to the Council.

KELLY'S "BUILDING TRADES' DIRECTORY."

THE fourteenth edition of Kelly's "Directory of the Building Trades" (price, 50s. net), has just been received. The usual amount of care appears to have been expended on the preparation of this volume to bring it up to date and make it as complete as possible. It contains lists of those engaged in building and the various allied trades and professions, starting with many pages of indices, and followed by an alphabetical arrangement of places under the various counties of England, Scotland, and Wales; a classified trades' section of London and suburbs; a separate section under the same heading for England, Scotland and Wales; and a list of the principal towns in Ireland. A noteworthy feature of this edition, introduced for the first time, is the last section, relating to proprietary articles and trade names arranged in alphabetical order. This useful addition to the book consists of over one hundred pages, and the information is printed on green paper to make it distinctive and easy for reference. The book is almost indispensable to all those interested in building, comprising as it does every trade and profession in any way connected with architecture and the building trades.

VENEERING.

MESSRS. F. Rendell & Sons, builders and contractors, of Devizes, write:—

"We are carrying out a contract for an architect who wishes to line the cupboards in the bedrooms with cedar wood veneer. Some of these cupboards come in brickwork recesses with simply a deal front. We see no difficulty in applying the veneer to the woodwork but, as regards its application to the brickwork, we are proposing to plaster same out in Portland and Parian cement, give it one coat of sharp colour, and attach the veneer to this.

"The timber merchants whose views we have asked are of an opinion that this will not be satisfactory, but before definitely deciding as to its application we should esteem it a favour if you would let us have your opinion upon it, and also perhaps you could suggest some other method."

[We should not advise Messrs. F. Rendell & Sons to veneer direct on to the painted plaster surface. If they were to veneer a sound three-ply sheet and fix it to grounds on the brickwork this should meet their case. Makers of veneered surface three-ply parquetry floors do not, we believe, guarantee results if their products are laid without an intermediate floor of boarding below. They evidently fear that moisture would attack the work, even through a layer of bitumen mastic, if their three-ply were laid direct on screeded concrete. As an experiment our correspondent's suggestion would be extremely interesting, however.—ED.]

L.C.C. AND PRIVATE ENTERPRISE HOUSING.

THE London County Council is prepared to give financial and other assistance to builders, investors and others in order to encourage the provision of housing accommodation.

Among the general conditions are the following:—No grant will be made in respect of a house the construction of which is begun before plans are approved by the Council and a qualifying certificate issued, and no portion of the grant will be payable until the house is completed. Not more than one grant will be payable in respect of any one house. A house in respect of which a money grant is made by the Council shall not, for a period of at least three years, be used otherwise than as a separate dwelling-house, and no addition thereto or enlargement thereof shall be made without the consent of the Council. In order to qualify for one of the money grants, or for the grant of a building lease, a house must be completed before October 1, 1925, and must be either a two-storied house (which may contain an attic) with a minimum of 620 and a maximum of 950 superficial feet; or a structurally separate and self-contained flat or a one-storied house with a minimum of 550 and a maximum of 880 superficial feet.

The Council is prepared to make money grants in respect of approved houses and flats, erected and maintained *for letting* for residential purposes at inclusive weekly rents fixed by comparison with the rents of existing houses in the same neighbourhood. For a house with not more than two bedrooms, with or without a parlour, a grant of £9 a year for 20 years; for a house with more than two bedrooms, a grant of £8 a year for 20 years. As an incentive to the production of approved houses in large numbers, an addition of 5 per cent. will be made to the grant in respect of each house in excess of 100 provided by one agency—making it £9 9s. or £8 8s., as the case may be, and a further addition of 5 per cent., making it £9 18s. or £8 16s. in all, will be made in respect of each house over 300 so provided. The grants will be made to the person by whom the rates on the houses are payable and will be paid by annual sums, or under such other arrangements as will ensure that the houses remain available *for letting*. Assistance under this head may, if so desired, take the form of an undertaking by the Council to provide part of the periodical sums payable to a building society or other body or person in respect of interest on, or repayment of, advances made for the purpose of building or purchasing a house.

A purchaser of a new house *for his own occupation* (including any person employing a builder to erect a house in which he intends to reside), provided that he satisfies the Council, after due consideration of his financial resources, as to the need for a grant, will be eligible to receive from the Council a grant equivalent to £6 a year for 20 years, or a lump sum of £75.

The Council is prepared before October 1, 1926, to consider applications for advances on loan from persons or bodies of persons (*a*) constructing or altering or undertaking to construct or alter houses, or (*b*) acquiring or undertaking to acquire houses the construction of which was begun after April 25, 1923.

The Council is prepared before October 1, 1926, to consider proposals for guaranteeing the repayment to an incorporated building society or an industrial and provident society of any advances made by such society in excess of the amounts which the society ordinarily lends to its members to enable them to build houses or to acquire houses the construction of which was begun after April 25, 1923, provided that the total amount advanced in any case (including the amount guaranteed by the Council) does not exceed 90 per cent. of the borrower's interest in the property to be acquired by means of such advance. Such guarantee may be given in respect of houses situated within the county of London of an estimated value (including the value of the freehold site) of not more than £1,500. A guarantee may be given in respect of a house for a money grant is also made. The supe area of any dwelling in respect of which guarantee is given must not be less tha feet if it comprises two stories (with po an attic), nor less than 550 feet if it consi a flat or a one-storied house.

Permanent facilities are provided unde Small Dwellings Acquisition Acts for to persons desiring to purchase the fre interest in possession, or the leasehold in in possession of at least 60 years unexpir the date of the purchase in houses (either al built or to be built) for their own occup The market value of the freehold shal exceed £1,200.

Requests for forms of application shou addressed to the Clerk of the Council, The C Hall, Westminster-bridge, S.E.1, or persona the County Hall (Room 307). Persons de of obtaining building leases of sites o housing estates of the Council should to the Valuer to the Council, The Old C Hall, Spring-gardens, S.W.1.

HISTORY OF THE PLUMBERS' COMPAN

PERHAPS it is because we have grown a tomed to perfection of workmanship in plumbing service that we demand it as a and are ready to see in any small defect occ to revile the plumber, for, in other days, simpler state of existence, when the scie and sanitary side of his work was far less vanced than it is to-day, he seems to have held in the highest esteem. Mr. F. J. Wald his historical account of the Worshipful pany of Plumbers of the City of Londo which body he was master in 1921, bring light many interesting facts concerning ancient guild, including a translation of Ordinances of Edward III governing the conduct of the plumbers' trade in A.D. 13

The book is illustrated with a frontis in colour, showing the armorial bearings of Plumbers' Company, reproduced from original grant made by Robert Cook, Clarenc King of Arms (1588), under Queen Elizab The text of the "Grant of Arms" indic the change in spelling that has occurre the English language since the time of Sha peare, the Herald signing his name and ti "Robt. Cooke, alias Clarencieulx Roy d'Arm Science is written "Seyence"; continue "contynewe"; and faith with a double and a final "e."

The crest of a silver fountain suggest brighter and gayer side of plumbing in con tion with the water supply and ornamenta of gardens that all artists and craftsmen wish to see revived in England.

The book also contains instructions, "I to Become a Plumber—Freedom and Li of the Company," and a list of fees to be by the members of different grades or rank

(For rates of wages in the Building Trade in Scotland, see page 742.)

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Leith.—HOUSES.—The Edinburgh Corporation have decided to invite tenders for the erection of 18 houses at Sheriff Brae, Leith.

Edinburgh.—HOUSING SCHEME.—A joint committee recently visited the Lochend Estate, which was purchased some time ago by the T.C., with a view to considering how to lay it out to the best advantage. The Housing Committee are anxious to acquire about 90 acres for its housing scheme, while the Parks Committee want 40 or 50 acres for additional recreation facilities, including the extension of Craigentinny Golf Course.

Falkirk.—VARIOUS.—The Dean of Guild Court has passed plans submitted by the Provost, Magistrates and T.C. for the extension of the boiler-house, and erection of a cooling tower and steel chimney at the Corporation electrical power station. The estimated cost of the proposed work was £3,700. The following plans were also passed: Falkirk Iron Co., Ltd., to erect a canteen at their works, to cost about £900, and a garage estimated to cost £200; Mr. William L. Hannah, Ladysmill, Falkirk, to erect a bungalow in Albert-road; and Messrs. J. A. Towers, Grahams-road, to erect a storage shed at their brickworks in Grahamston.

Glasgow.—SLUM CLEARANCES.—The Board of Health has approved of the slum clearance scheme formulated by the Corporation, which involves the demolition of about 2,000 houses in various areas, and the provision of alternative accommodation in different parts of the City. The clearances will be made in Cowcaddens, Gorbals, Anderston, Calton, and Mile End, and the districts chosen for the new houses will include Hamiltonhill, Yorkhill, Polmadie, Belvedere, and Springburn. The scheme is to be pressed forward immediately.

Paisley.—TRAMS SUB-STATION.—The Dean of Guild Court has passed plans for the erection of a tramway sub-station in Abercorn-street; also a double villa in Gartmore-road, and a bungalow in Glasgow-road.

Clydebank.—FOOTBALL STAND.—Plans have been passed for a new stand, to seat 1,500 persons, at Clydeholm Park, for the Clydebank Football Club, Ltd.

Coatbridge.—VARIOUS.—The Dean of Guild Court has passed the following plans: A. B. Brown, Ltd., to erect a garage in Mauldslie-street, at an estimated cost of £500; Scottish Tube Co., to erect a galvanising shop and an oil store at the Union Tube Works.

PAYMENT OF POOR RATE ARREARS.

AN interesting point to ratepayers has been decided in the two cases, Gill *v.* Mellor and Gill *v.* Monday (*Weekly Notes*, October 27), which were heard together. The Appellant Gill was an assistant overseer and rate collector and the two respondents were ratepayers who had been summoned for non-payment of sums in respect of Poor Rate. The point in the case was that the sums sued for were arrears brought forward from the previous year and the Respondents contended that as the demand for payment was made after the expiration of the year for which the rate was laid no order for payment ought to be made. The rate was made April 2, 1921, the demand was made September 26, 1922, and the summons was served March 15, 1923. The Justices had held that they had no power to make the order for payment because the demand for payment and the proceedings to recover payment should have been made and taken within the year in which the rate was made.

A case was stated for the High Court, and the Court held that there was an absence in the provisions of the Statutes dealing with the recovery of Poor Rate of any requirement that the demand should be made within the year; equally there was absence in the provisions of the Public Health Act, 1875, which governed the levying and mode of collection of the general district rate that the demand should be made within the year in which the rate was laid, and it followed *a fortiori* that proceedings need not be taken within the year. The case was therefore sent back to the magistrates with a that a demand within the year was un

THE RENT ACTS
POSSESSION.

A CURIOUS case is reported in *T* October 23, from the Shoreditch Cou A man, aged 88, was applying for an possession. He had owned the house to obtain possession of for over 20 ye was let at 18s. 11d. a week. He was l his wife in rooms, two of which he occu his wife, and in the same house his da war widow, lived with her child, but to remove into his own house bu occupy the ground floor. The Cou Judge, according to the report, held Rent Acts only provide for a case landlord "reasonably" requires to o whole house, and an order could not for possession, where as in this case the required possession of only part of t and to let the other part.

This case seems to disclose a serious the Acts. Where part of a house is let s so as to be a dwelling house itself u Acts the landlord can claim possession of the house, but in that case the ho the purposes of the Acts divided separate entities. This is clear from subsection (1) of the latest Act, that Here the whole house was let as one, landlord in seeking possession was under section 4 subsection (1) (*d*), a that subsection he had to show th dwelling house was reasonably requ occupation as a residence for himself any of the specified persons. The exi alternative accommodation in a case present is dispensed with by paragrap the same subsection since the landlor the landlord before June 30, 1922.

The difficulty in this case appears to h that the landlord could not comply subsection because he was not prepared could either by himself or his family o residing with him occupy the whole a residence, yet the very case here put is dealt with in the Acts but only in c with a landlord who became the landl service with the forces during the wa paragraph (*f*). That paragraph is wo way which seems to suggest that eve case a possible loophole was afforded possession, for it provides that posses be granted to a landlord who has t landlord after service who "requires t for his personal occupation and offers th accommodation in the same dwellin such accommodation being considere Court as reasonably sufficient in the stances."

The point is under paragraph (*f*), the has to show he "requires the house personal occupation," although he intend to occupy the whole of it, and the position in this case. Could the not therefore have applied for possessi whole house as reasonably required by occupation as a residence for him (although alternative accommodation necessary to be proved in his case) hav the remainder of the house to the t accommodation? The tenant, howeve not accept part of the house, and the might not be willing to take the risk c the whole house upon his hands, and form of this application no doubt it h refused, and in any case as we hav there would be difficulty in granting the Acts strictly construed, and the ca fore seems to indicate a flaw in the Act such times as these the application by a to occupy part of his own house seems an reasonable one which should be provid this restrictive legislation.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns o Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Masons' Labourers.	Plasterers' Labourers.

Control of the Cement Industry.

The *Daily Express* understands that control of the Associated Portland Cement Company has passed to a newly-registered company, named the Associated Anglo-Atlantic Corporation. The new Corporation has for its chairman Sir Philip Nash, who holds, among other positions, that of chairman of the Metropolitan Vickers Company.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ASHTON-UNDER-LYNE.—The T.C. is proposing repaving of Cowhill-lane and Junction-street, reconstruction of tramway track and portion of Manchester-road, conversion of percolating filters at the sewage works, and construction of sludge lagoons, estimated to cost about £62,000.

AUDENSHAW.—Plans passed by U.D.C.: Extensions Delta Works, for Mr. Austin Hopkinson, M.P.; villas, Kershaw-lane, Mr. Lomas; four houses, Droylsden road, Mr. S. Hadfield.

BASLOW.—A proposal is on foot to relieve the traffic over the narrow Baslow bridge. A scheme for a new bridge over the Derwent is being considered.

BELFAST.—Plans passed: Villa and garage, Lansdowne-road, for Messrs. Thomas McKee & Sons (architects, Messrs. Hobart & Heron); alterations and additions to shops on Woodstock-road, for Mr. A. Fusco (architect, Mr. S. J. McAvoy); eight villas, Bloomfield-road, for Mr. Joseph McMaster (architect, Mr. Hugh Gault); dining-room for factory of Messrs. W. Ewart & Sons, Bedford-street (builders, Messrs. McLaughlin & Harvey); villa and garage, Myrtlefield Park, for Mr. F. C. Hughes (architect, Mr. T. R. Eagar); two semi-detached villas, Stranmillis-gardens, for Mr. William Pollins, builder; shop, house and store in Crimea-street, for Mr. W. Mackey (architect, Mr. James H. Beggs; builders, Messrs. Rea & Beggs); Home for Aged Men, Ravenhill and Ormeau roads, for the Nazareth Home (architects, Messrs. McDonald, Lamont & McDonald); addition to lecture hall, Stranmillis-road, for the Select Vestry of St. Bartholomew's (architect, Mr. A. H. S. Warren); villa, Myrtlefield Park, for Mr. R. P. McGregor (architect, Mr. T. R. Eagar); bungalow, Ormiston-crescent, for Capt. T. Robinson (builder, Mr. W. Scott); villa and garage, Shandon Park, for Mr. W. J. Shields (architect, Mr. R. S. Sutcliffe; two large greenhouses and nursery on Knock-road, for Mr. Ernest Camlin (architects, Messrs. Munce & Kennedy); villa and garage at Beechlands, Malone-road, for Professor Gregg Wilson (architects, Messrs. Blackwood & Jury); Parochial Hall, Donegall Pass, for the Select Vestry of the Magdalene Church (architect, Mr. J. St. J. Phillips); villa in Sydenham-avenue, for Mr. Gordon Rogers (architect, Mr. C. A. Aickin); additions to houses, Glenburn Park, for Mr. Jacob W. Lester; additions to the Belfast Pure Ice & Cold Storage Co.'s premises, Great Victoria-street (architects, Messrs. Ferguson & McIlveen); 24 houses, St. James's-road, for the White Cross Building Society (architects, Messrs. F. & J. McArdle)

BLYTH.—Plans approved by T.C.:—Two cottages, Ridley-avenue, for Messrs. Lund & Tynemouth.

New Road Across Scotland.

It is now practically certain that the new mid-Scotland road between Edinburgh and Glasgow will be proceeded with. There is a possibility that the work of construction may be started this winter. The sole obstacle to the scheme—that of costs—appears to have been removed by the various authorities interested signifying their approval of a substantial proportion of expenditure which the Government is prepared to meet. The estimated cost of the scheme is £1,865,000.

- DEPARTMENTAL 'PHONES AT THE COUNTY HALL.

interest evinced in the New County London County Council has been he recent completion and putting of an extensive "Strowger" lephone installation in that build- constitutes the largest private automatic telephone exchange in n. The new installation not only ly and essentially private inter- on between some 650 different in the building, but also gives gh an associated manual telephone to the public telephone exchange the many outlying districts and gh administrations which come risdiction of the London County entire equipment has been and installed on behalf of the Telephone Department by the lephone Manufacturing Co., Ltd.,

ge operates on what is known as basis. The act of calling any e system entails three successive the dial attached to the telephone alling party. This manipulation tip is, however, extremely simple six seconds only. Assuming the to be disengaged the response is d in the event of an engaged line udible signal is at once heard in t the calling station. Clearing at n of a conversation follows the f the receiver upon the switch- instantaneous, the line therefore tely available for another call. ured, and it is impossible for a interrupt or to listen in to a already in progress. For the aining connection with the public hange system an eight-position board has been intalled as a the automatic installation.

FIRE INQUIRIES.

THE report of the Royal Commission on Fire Brigades and Fire Prevention, dated July 20, 1923, just published, contains some interesting findings on fire prevention.

Regarding fire inquiries, the Commission states that it cannot recommend that the coroner's functions should be extended to the holding of fire inquiries where no fatality has occurred, but that such inquiries should be conducted by persons possessing special technical qualifications in building construction, engineering, fire extinction, &c., that for this purpose a panel of persons with such qualifications and experience and resident, so far as possible, in convenient centres throughout the country should be drawn up by the Secretary of State, and that the individual to hold any particular inquiry should be chosen from this panel as occasion requires. The two authorities to be responsible for initiating the inquiry should be the Secretary of State in any case where it appears that such an inquiry would be in the public interest, and the county councils and the councils of county boroughs should also have power to initiate an inquiry into any fire within their areas.

To the above suggestion a reservation was made by the Chairman (Sir Percival Maitland Laurence), to which Sir Maurice Fitzmaurice (formerly Chief Engineer to the L.C.C.) also agreed, to the effect that, in cases where there is suspicion of incendiarism, the powers conferred on the coroner by the City of London Act, 1888, combined with the inherent powers of his office, seem well calculated to serve that purpose. As in many cases, other matters—such as building materials, structural conditions, the provision of means of escape, &c., would have to be investigated, it would be desirable to appoint an officer having special qualifications which the local coroner in many cases would not possess. In such cases, however, should there have been any fatality, the coroner would still be required to hold an inquest. In suitable cases, he might be empowered to take the evidence of experts or receive the assistance, if deemed advisable, of a technical assessor. If, on the other hand, an *ad hoc* tribunal should be constituted, and the initiation of proceedings were to depend on the discretion of the local authority, cases would occur from time to time in which the discretion or administrative action of the local authority itself—*e.g.*, in granting a licence for an hotel or theatre, in providing for means of escape from factories or other buildings, in the equipment and organization of the fire service, or in other respects—might be called in question, and in which, therefore, there might be some disinclination to initiate an inquiry into the circumstances of the fire.

The report continues: "References have been made to the practice in the City of London, where many such inquiries have been held by the present coroner (Dr. Waldo), who gave the Commission much useful information as to the history of the subject and his own experience and methods, and by his two immediate predecessors in office. It certainly seems somewhat anomalous that Dr. Waldo should be empowered at his discretion to investigate any fire occurring in the City, but should have no similar power in Southwark, where he holds the same office." (Dr. Waldo has for several years past suggested in his annual reports the extension of the City Act to Southwark.)

Dr. Waldo, in his evidence, pointed out the frequency of fires due to defective electrical installations and the need of a model set of regulations similar to those of the Institution of Electrical Engineers. A recent instance of this danger was exposed at the non-fatal fire inquest held before Dr. Waldo at 8, Redcross-street, City, E.C. The installation was out of date, and electric wires, 'phone wires, and composite leaden gas pipes were in close apposition. The Commission in their Report, in connection with this subject, recommend that electrical installations should be periodically inspected and tested in the case of all old buildings, and defective installations should, so far as practicable, be brought up to modern standards.

Dr. Waldo also stated that the following bodies were in favour of an extension of fire inquiry as carried out in the City of London during the past thirty-two years: (1) The Home Office Departmental Committee, in their Report published in 1909; (2) the Coroners' Society of England and Wales; (3) the Associated Chamber of Commerce; (4) the Association of Professional Fire Brigade Officers; (5) the Borough of Portsmouth, in one of their (General Powers) Bills; (6) the Association of Municipal Corporations; and (7) the Insurance Institute of London.

A HOUSING SUGGESTION AT DOVER.

OUR attention has been drawn to a report in the *Dover Express and East Kent News*, of October 5, concerning an offer made to the Dover Corporation by Mr. W. H. Grigg to build twenty houses in the Borough, the Corporation to take a lease of them on a 5 per cent. basis, and afterwards, at an agreed date, the houses to become a gift to the town in the form of almshouses for the poor. The conditions proposed were that for a period not exceeding fifty years Mr. Grigg should receive 5 per cent. on his expenditure. Trustees were to be nominated, and Mr. Grigg would convey to them the land, &c., undertaking to erect the twenty houses at a cost not exceeding £400 to £450 per house, to be approved by the Council and the Housing Committee. The trustees would invest £2,000, which was £100 a house subsidy, which the Corporation had already agreed to give per house erected, and this would be used for maintaining the houses. If the income from the houses exceeded the interest payable, the balance should be invested.

The two points raised by the Corporation appear to have been, first, that whereas Mr. Grigg was anxious that the maximum price of the houses should be £450, so that they might be worthy of the town and capable of being subsequently converted into two separate flats when used as almshouses, it was feared that, if the houses exceeded £400, the scheme might be jeopardised, as the higher the cost the less likely were the houses to produce the requisite 5 per cent. The second point was more formidable: That the Corporation had no power to give a guarantee that the 5 per cent. would be paid, even though the risk involved in such a guarantee might be extremely slight.

Without entering into the questions at issue, we would point out that Mr. Grigg's offer is certainly a generous one, since under it, at the best, he gets a guaranteed 5 per cent. for fifty years, and nothing more; whereas, if he put the same money judiciously into trustee securities, he could obtain, not only the 5 per cent. but retain his capital to use or re-invest at the end of the period. We hardly imagine that the Corporation will forego so generous an offer over any technicalities that may require adjustment, and we only wish that other public-spirited persons would make similar offers elsewhere.

Builders' Dinner-Time.

The national leaders of the building trades operatives have, it is understood, endorsed the action of the London employers, in regard to the dispute which has arisen over the meal-time interval in the London area. There was a conference on Tuesday night between the employers and the men's national leaders. The outcome of it was that the employers will on Thursday post notices on all the works notifying the men that the dinner interval will be half-an-hour only, from twelve to 12.30, and that the whistle will go for work to terminate at 4.30 p.m.

The London Regional Council of the Operatives' Federation has ordered the men to take an interval of one hour for dinner. In view of the endorsement of the employers' interpretation by the national leaders, it is not expected that the dispute will be pressed to a serious issue.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges, percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole information given on this page is copyright.

TENDERS.

plications for insertion under this heading should ssed to "The Editor," and must reach him not n Tuesday evening.
es accepted. † Denotes provisionally accepted.
es recommended for acceptance.
es accepted subject to modifications.

N.—For erection of new kitchens and laundry, lterations at the Poor Law Institution, for rdians. Clerk to the Guardians, 46, High-lton, Hants :—
. Gaze & Sons, Ltd., Kingston-on-Thames £8,473
man, Lowry & Puttick, Haslemere 7,998
. & Sons, Hartley Wintney..... 7,998
lon, Ball & Co. Farnham, Surrey 7,950
& Sons, Farnham..... 7,700
elwhite & Son, Basingstoke..... 7,654
Kemp, Alton..... 6,981

OR (N. WALES).—For the erection of new ildings in five blocks, at University College :—
ope & Colls, London £66,800

TON.—For (*a*) two additional class-rooms, ional out-offices; and (*b*) removal of sloping Boys' and Girls' Departments at Nether-ool, for the Nottingham C.C. :—
. W. Brough, Beeston .. £1,740 9 8
. W. Brough, Beeston.... 161 11 6

FORD.—For extensions to shop premises at ningham-lane, for Mr. Elliott. Messr riggs, architects, Morley-street, Bradford :—
n—J. G. Burgess, Manningham.
r—J. W. Holdsworth, Bradford.
ber—W. Smith, Bradford.
alter—Messrs. Tunstall's Rock Asphalte Co., Leeds.

FORD.—For the erection of condensing , for the new 20,000 kilowatt generator at ration's Electricity Works, Valley-road :—
Marchant & Morley, Bradford.

OL.—For erection of public convenience at nyth Park, for the T.C. Mr. L. S. McKenzie, neer, Bristol :—
& Slaughter £2,662
nown 2,640
Hayes & Son 2,584
alters & Son 2,516
eeks & Sons, Ltd..... 2,295
(All of Bristol.)

N BAY.—For alteration of new pier for the U.D.C. :—
nwaite, Birmingham.....£3,650

STER.—For extensions at Workhouse for Balby B.G. :—
nkinson & Sons, Ltd., Doncaster..£7,500

BAKE.—For installation of heating appara-ol, for the Nottingham C.C. :—
ufty, Gotham £276 10

AVE.—For extensions, for Mr. Norman at "Town Head" :—
arnley & Sons, Bradford.

ON.—For erection of 12 houses in Sanctuary-he T.C. Borough Surveyor, Helston :—
Pengilley, Camborne..... £4,125
tenders : £4,440, £4,793 10s., £5,272 15s., 5,556 5s., £5,820. For one block of our houses, £1,776.

N.—For construction of public convenience adway, for the U.D.C. Mr. A. O. Knight, Town Hall, Hendon :—
ood & Sons, Luton £2,850 0 0
r & Payne, Finchley 2,605 7 11
Hill, Hendon 2,513 0 0

Y.—For erection of shop, office and dwelling-tle-street. Mr. T. G. Archibald, architect, quare, Huntly, Aberdeen. Quantities by

on & Tipp .....
nder Tronach .....
Milner.....
f Douglas .....

INDUSTRIAL RESEARCH.

HE work of the man of science is of importance not on'y to scientists, but to the world at large, and though this truism is less recognised in this country than in most others it has surely been brought home to the most indifferent during the last decade. the many practical applications resulting directly work of the laboratory were wont to be accepted by an without any acknowledgment of their source of n or the discovery of the basic principles upon which lustrial application can proceed. The war and the competition have changed this attitude. The indus- now not only tolerant of science, but of necessity o scientific men to solve the problems by which he is d in his search for improved processes and economies ction. As the war has proved, scientists hold the their power, and were they to combine could easily fortunes for good or evil. These reflections come to e result of the perusal of the Annual Report of the ee for Scientific and Industrial Research* which gives nt of the year's work in initiati ng, co-ordinating, and ways stimulating research in this country as applied ractical needs of a vast number of industries upon ie life of the nation depends. The exigencies of economy which have fallen with so heavy a hand on nment Departments have not spared the work of this e; nevertheless, a perusal of this report reveals sive activity which indicates no slackening of effort, e of the developments which we shall touch upon ve a particular interest for our readers, the develop- which we refer being associated with the Building Board. The Department controls such important ions as the National Physical Laboratory, which extensions in prospect, and the Geological Survey Britain, and, besides special Boards of its own, supports workers and associations by grants of money, and co-ordinating centre to prevent overlapping and to information. It thus keeps workers in a given ther, though separated geographically; and, more than raws attention to points of contact which experience ur frequently in researches of very diverse character. search associations receive, as a rule, grants for five d are warned in this report that except in special nces such grants will not be renewed at the close of d. We read that only one new association has been uring the year under review, no doubt owing to trade n and the Government's policy of economy.

tion should be drawn to the Forest Products Research orking in association with Kew Gardens as far as otanical matters are concerned, but having at Farn- a research station at the aircraft establishment. easoning plant, part of which is on a commercial been erected, together with a laboratory. Experi- on warping and twisting under different conditions ing and on sterilisation are being undertaken here, chanical tests are projected. For many years the stitute of British Architects has urged upon the nt the need for researches upon dry rot and like timber which cause such a heavy annual expenditure , and it is interesting to note that this need is referred the Board "is endeavouring to initiate concerted the matter." We hope that this long-overdue endeavour will soon reach fruition, and would direct the Department to an opinion, expressed long ago by the R.I.B.A. Science Committee, that an initial urgent need is to regulate the storage of timber in quantity to prevent the spread of infection. Only this week one of our architect contributors has informed us that he is spending £20,000 on one building, due to the ravages of "dry rot" and "beetle."

The Building Research Board, under Mr. H. O. Weller, continues its activities, and after turning its attention to methods of construction for small houses—which, in passing, we venture to think has shown that ordinary bricks still hold their own—this Board has been carrying out researches on the setting and hardening of cements, on slag and iron cements, and allied problems. Another fundamental research is that on the decay and preservation of stone, but this work is now merged in that of a special committee appointed for this purpose, under the chairmanship of Sir Aston Webb, on which the various aspects of the subject are well represented. The Home Office Committee on Industrial Paints recently recommended, among its findings the setting-up of a committee to make impartial experiments upon paint materials, which investigation will presumably be carried out as to experimental work by the Research Department, which has already made a few tests on special paints. Another important matter brought to the notice of the Department by the R.I.B.A. is the use of plastic floorings, usually magnesite cements; many of those on the market have not proved wholly reliable, and the wide use of these jointless floors calls for some proper specification which will carry a guarantee of reliability. We understand that the Department has carried out investigations in this direction with very encouraging results, which may lead to both cheaper and more satisfactory products for this purpose. Heat transmission through walls and roofs has been under investigation at Teddington and Acton, while the economical firing of brick kilns, the weathering of bricks and tiles, the production of waterproofing solutions and distemper, form other subjects which have come under investigation. Finally, as far as our special interests are concerned, the question of architectural acoustics is coming under consideration, and the sound conductivity of certain materials has been taken up.

Remembering that the work to which detailed reference has been made is only a part of the field of investigation covered by the Department's activities, it may be fairly contended that matters dealing with building and engineering construction are now receiving a suitable share of attention, in spite of the restrictions placed upon activities at the present time. These are days in which no stone can be left unturned to render building operations less costly in the long-sighted aspect of this word. True economy in building means the use of the most efficient materials, and efficiency can only be ensured by a thorough understanding of materials, which involves a scientific knowledge of their properties only to be attained by long and patient investigation. In the past those concerned with these materials have not perhaps been keenly interested in their scientific history, but the difficulties of these latter days should awaken a greater appreciation of what science can do for us. In conclusion we return to the note upon which we began—the great value and weight of scientific investigation, and the elucidation of scientific principles in all things material. For these principles we must look to the trained chemist, physicist, botanist and geologist, and the more support he is given by outside interests the more will his work tend to assist those who give him such support.

of the Privy Council Committee for Industrial Research, 1923. nery Office. Price 4s. net.)

NOTES.

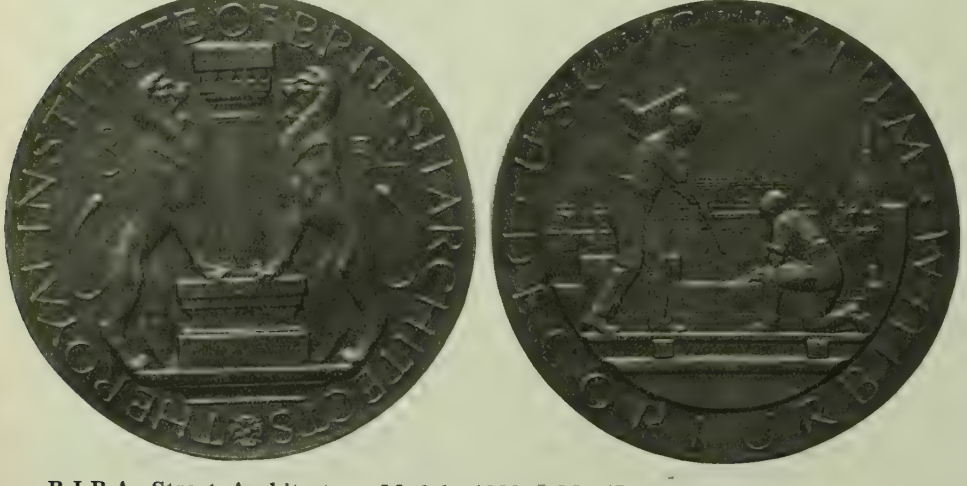
The Influence of Buildings.

True as is the saying that "No man liveth to himself," we are all very apt to lose sight of the significance of the fact; and, sure as it is in regard to our character and acts, it is well to remember how vital a truth it is in regard to our buildings. After a generation is dead the buildings it created carry on their influence for long years after, and much of our vulgar meretricious building of to-day influences the lives of the present generation as well as many which follow. We suppose this only needs to be stated to meet with ready acceptance but it is well that those who are anxious for the production of fine architectural work should ever seek to remind those who have the power to call it into being of their responsibility. The long list of buildings which disgrace our cities, towns and villages largely results through either ignorance or carelessness, and we can only hope for better things when building owners and those who control building designs become really determined to get the best results. People are perhaps more really interested in architecture than architects give them credit for, but, even if they are, that does not imply any ability to know what is the best work or how to secure it. As an illustration of the varying point of view of the public we may note that many buildings are intended to form a conspicuous advertisement for the owners or occupiers, and we can compare this fact with Professor Reilly's statement in the first of his articles on modern architecture in the *Weekly Westminster* that in the eighteenth century "any excessive expression of individuality or of personal importance in a building was considered bad manners." As Mr. Tryston Edwards is writing a book on good and bad manners in architecture we may find cause seriously to question the quality of many modern buildings. We may not all agree as to what constitutes the best architectural expression, but it would be well if a few more thousands of our citizens could be made to take a real interest in the quality of the buildings they see.

Waterloo Bridge.

Yet another London bridge is now receiving public attention. Waterloo Bridge, so rightly and so much admired, though of rather gloomy character is one which should on no account be interfered with—our record of modern bridges is much too poor—and we are glad to notice the objections made to any alterations by Mr. H. V. Lanchester in his interview with a representative of the *Observer*. It is not even, as he states, a "safe proposition," while there is every objection to alteration on æsthetic grounds, as any widening scheme must necessarily mutilate its original character. Nor is there sufficient evidence that on grounds of traffic convenience such a change is necessary; while any such scheme may prejudice the far more desirable one of a new bridge at Charing Cross. Mr. Lanchester goes on to suggest—in the interview to which we have referred—as an alternative, a new bridge connecting with the eastern arm of Aldwych by St. Clement Danes' Church which he considers would make "a very nice symmetrical arrangement." We are inclined to think, however, there is real objection to cutting up the river with a further bridge so near to Waterloo Bridge and so obscuring the view, if it can be met in another way, and the scheme for a new bridge at Charing Cross would avoid this and go far to meet the necessary traffic adjustments, without any such disturbance of the open course of the river. The Charing Cross scheme holds the field, and it appears to us that the aim should be to concentrate on this.

Armistice Day.



It can hardly be amiss to dwell for a moment on the Armistice Day celebration which has just passed with its poignant and tremendous memories for each one of us. For in one sense it is deeply necessary, in considering prospects, to dwell on more t economic adjustments, the new on which we hope to rely, and to beware of too easy solutions a sighted panaceas. Something m the restoration of our economic li required if civilisation is to re- itself in better ways, in that it only our economic but our spir that fell into ruins. And such c tions should appeal particularly t and all those whose work assum thing more to them than buying ling—for it is through them, thro arts generally, that the leaven mu In the case of architecture at the time, for instance, there are p of great moment if it is to retain it freedom, and these ask of us than a restatement of our be spiritual revaluation of the imp of art to life, and of the claim our work makes upon us; these furthered by genial optimisms. only through facing the funda issues that art can go forward of its service to humanity; a thus will the artist secure the that his work requires.

Citizenship and Art.

It is sometimes sai some appearance o that citizenship before art and th first duty lies here. But this is o the truth, for the best citizen revealed through faithfulness to the of the citizen's work and the that this makes upon us is greate pride of the tax-paying citizen m come an expensive luxury if he his independence at the cost of a world war, and there is a higher of citizenship. What this means each one will best interpret for h as he understands where his pense lies; but if we ask where th be found, it lies mostly in the thi have forgotten, in service which more than self-interest, in a si which captures more than success. may not lead the arts to wealth world understands it, but it wi splendour to art; it will not giv to the artist, but it might chan face of the world.

Medals and the Machine.

We are constantly s the resource of short art in the mistaken ignoring its inexoral quirements. Unfortunately for thos like Sir Edward Iliffe, find in "sculpture" the compromise whic make it easier for us, there are n compromises which do not involve t of the very quality which can preserve art's freedom to expr Mechanical accuracy—the "faithf production" of a modelled design, w by the reducing machine or by "

" will not help, as is wisely ut by Mr. Steward in his letter *mes*. You must have the artist re in a work of art, and there are utes by which you can reach art im. And it is just because of our medals remain commonplace out artistic intention. The does not feel, is not inspired, useful servant to man in other d it is because we forget this ue, in Sancho Panza phrase, to cat with two tails. The remedy inted out in the letter to which eferred lies " in the employment e artist-engravers, or the com- of sculptor and the engraver apable of realising the artistic of the designer." Happily the his need is growing, and it will supersede the fiction of " short nd the fallacy that through al reproduction we can reach art.

JUST as we notice the in- tensified perception of sound in primitive races, so also is seen an alertness of observa- eyesight revealing much that he ordinary person in a more civilisation. Miss Claire Gaudet, who continues her interesting lectures on recent archæological excavations, illustrated this intensified observation in the case of the scratched outlines on stones representing animal life in the Flint Age. These suggest attitudes and quick movements of animals, such as we only find revealed through the retarded photograph, and which our eyesight does not ordinarily perceive. Her account of the development of building in Egypt shows how the natural form of the material governed the appearance. Building first in mud and reeds—reeds or palms bound together and coated with mud—the ties of these formed a waist at either end, and when they ceased to build in these materials, and used stone, they reproduced a similar form, such as may be seen in the columns of temples, and so we are able to trace the original natural source from out of which grew the more advanced building. The form having grown out of the material, it continued to influence later developments. The Egyptians measured their time by Sothic cycles, that is the revolution of the Dog-Star, which takes 1,460 years. Much interesting information was communicated by the lecturer concerning the tomb of Osiris at Abydos. This tomb, measuring 30 by 20 metres, was built of sandstone, in great blocks worked with much finish. It is expected that further work at Abydos may prove very important, as much material may exist down the wells not yet explored.

A Durham Badge.

THE illustration of the Chairman's Badge of Office, which we give this week, shows the badge presented by Sir Frank Brown, formerly Chairman of the Durham County Council, to the Council for its future use. It is executed in gold and enamel by Mrs. K. W. Adshead-Austin, from a design by Mr. H. V. Lanchester, of Messrs. Lanchester, Lucas & Lodge. The centre shield is that of the Palatinate of Durham with gold cross and lions argent on a blue ground. A plain cross is used instead of the cross patonce, or the cross fleury, as being more appropriate to the badge of a civil body. The ship surmounting the shield is an indication of the port and shipbuilding interests of Durham; while on each side a miner's pick and shovel and the miner's lamp below indicate the major industry of the county. The date is that of the foundation of the County Council, and their monogram appears on the small patera from which the badge hangs. The turquoise margin may be regarded as a symbol of the four beautiful rivers that flow through the county, and it will be noticed that it appears in four sections divided by the devices already mentioned. The blue selected is that usual in heraldic work, slightly varied in the direction of the Palatine purple. On the back of the badge is an inscription recording its gift to the Durham County Council.

GENERAL NEWS.

Professional Announcements.

Mr. Cyril A. Farey, A.R.I.B.A., has removed to 19, Bedford-square, W.C.1. (Telephone: Museum 2420.)

Mr. J. Haigh Baxter, A.M.Inst.C.E., civil engineer and architect, has removed from Muslin-street, Newton, to Norfolk-street, Market-place, Hyde, near Manchester.

Appointment.

Mr. G. B. Lockwood, Deputy County Surveyor to the West Riding County Council, has been appointed County Surveyor to the Cumberland County Council.

Architect's Estate.

Mr. W. P. Park, of Ashton-upon-Ribble, Lancs, retired architect and surveyor, left estate valued at £16,328.

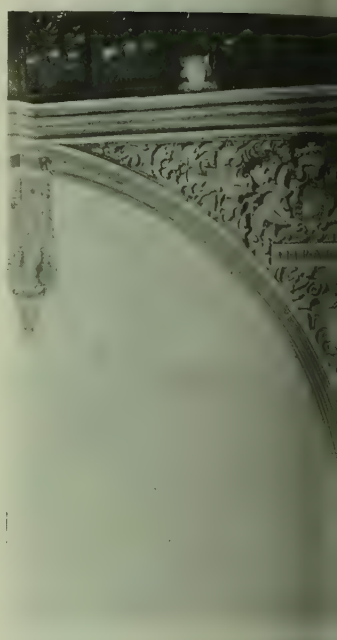
The Rebuilding of Ypres.

On Monday, November 19th, at 8 p.m., Mr. G. Topham Forrest, F.R.I.B.A., the Architect of the London County Council, will read a paper on "The Rebuilding of Ypres," illustrated by lantern slides, showing the city as it was in August, 1914, as it looked in November, 1918, and as it now is after the process of restoration has been largely accomplished. A number of distinguished guests have accepted the Council's invitation to be present, and it is hoped that there will be a large attendance of the general public. The lecture will not be of a professional or technical character. The lecture is one of the R.I.B.A. general meetings, and will take place at No. 1, Wimpole-st., W.

Registration as Probationers R.I.B.A.

On the recommendation of the Board of Architectural Education the Council of the Royal Institute has decided to accept, as the standard of general education required of applicants for the Probationership R.I.B.A., the certificates (covering the required subjects) of the following "Second Examinations" approved by H.M. Board of Education: The Higher School Certificate Examination of the Oxford and Cambridge Schools Examination Board; the Higher School Certificate Examination of the Oxford Delegacy for Local Examinations; the Higher School Certificate of the Cambridge Local Examinations and Lectures Syndicate; the Higher School Certificate Examination of the University of Bristol; the Higher Certificate Examination of the University of Durham; the Higher School Certificate Examination of the University of London; the Higher School Certificate Examination of the Northern Universities Joint Matriculation Board; the Higher Certificate Examination of the Central Welsh Board.

Obituary.



We regret to announce the death of Mr. E. J. Bennett, A.R.I.B.A., of Gravesend, which occurred on November 2. Mr. Bennett was a pupil of Messrs. Habershon & Pite, and was for some time in their office at Newport, Monmouthshire. He entered the office of Mr. H. D. Searles-Wood in 1881, and started practice on his own account in Gravesend in 1898, where his principal works were carried out. He also designed a house for the Right Hon. A. H. D. Acland, at Felixstowe. A correspondent writes, "Mr. Bennett was a careful and conscientious architect, and his work was a great pleasure to him; if possible, at times he was a little over-anxious about it. But all his buildings are excellently designed for their purposes and skilfully carried out."

The death has taken place of Mr. William Bevan, Coity Fields, Bridgend, who formerly held the post of Surveyor to the Bridgend U.D.C.

The death has occurred of Mr. Ernest Flint, F.R.I.B.A., of 80, Coleman-street, E.C.2.

ORRESPONDENCE.

ridge Collegiate Buildings Competition.

—The award recently given out in this
competition, to which the undersigned
ects had the honour to be invited, raises
more the fractious question of the asses-
f competitions in this country. In this
he result is thrice unfortunate, since it
a burden of responsibility and of un-
s, not yet removed, on the King's Col-
uthorities, the assessor, and the com-
s.

fly put, the gist of this particular com-
n is, we believe, as follows: For quite
e King's College has been in need of
chambers for its undergraduates, and of
library. It decided to put the entire
n in the hands of a Building Com-
of its own, under the chairmanship of
its most distinguished Fellows, Mr.
rd Keynes. The members of this com-
came to the conclusion that they might
ecure results more in accordance with
rit of the times if they addressed them-
to young architects.

ssessor of unquestionable probity was
in, who, we understand, was specifi-
alled to report upon the planning and
chnical character of the designs sub-
the Building Committee, placing con-
in its ability to judge the artistic
of the elevations, reserved to itself the
f ultimate choice. The proposed new
gs are to stand on one of the most
nt sites of Cambridge, namely, on one
sides of the lawn girdled by Clare
, King's College Chapel, and Gibbs'
ws."

designs were sent in, the assessor re-
on their planning, and the award was
ade Now, after examining all the
, it seems clear that something went
First of all, we are bound to say, in
respect, that the assessor took upon
a great deal of responsibility when he
to recommend the two schemes placed
d second. With regard to the first,
has certainly the advantage of having
staircases, which, on the face of it,
ly well lit, but the winners were able
them as they did at the cost of violat-
ndition thought to be highly desirable,
t six sets of chambers should be pro-
all upper floors, and as many as pos-
the ground floor. The winners pro-
0 as against a possible 22—a re-
e weakness far outweighing the gain
to each staircase. It should not be
ed that other designs had all their
equally well lighted, so we fail to
nd the recommendation of the assessor
iefly based upon this adequateness of
ners.

design placed second has the demerit
g two staircases facing Bodley Quad,
third facing the lawn, though, to be
e entrance to the third is in the pas-
ading from the lawn to Quad. The
to this entrance is exceedingly pre-
and its approaches inconvenient.
e understood it, the Committee, in its
ok the responsibility to endorse the
's judgment, but seemingly it did so
probing at all deeply in the difficult
of artistic merit of all the designs,
result is that a façade—indeed unfor-
-may soon face Clare and rob Gibbs'
ws" of its legitimate prominence.
atment favoured by the winners carries
le and fenestration of Gibbs' on the
e, but the bulk of the proposed new
s is so great that such treatment will
lm Gibbs' for ever. This façade,
r, has the fatal weakness of being
out insincere. Nowhere on its wings
express its contents. Is it possible
Building Committee of King's College
we give credit for the intention to
ncble building—is it possible that it
the character of a façade with win-
dows of different sizes lighting rooms of identical dimensions, with the window of one "gyp" being a mere long, narrow aperture, whilst the one next to it assumes the very proportion of the largest windows of Gibbs' itself, of substantial chimney breasts resting over voids? These discrepancies are due to the planning and treatment followed by the winners, and good modern planning will always turn its back to anything not straightforward or sincere. Such blemishes are not minimised, if we may say so, by the liberal sprinkling of "period" *motifs* made to punctuate both elevations. To reshuffle knowledge rarely increases its value, so to speak, and it is not likely the knowledge of *motifs* made available in this way will be appreciated in the future.

The Building Committee, by its well-meaning but confused action, has once more accentuated the plight of competing architects. No surer way of sapping their confidence could be found than the one which allows conditions laid down in the schedule to competition to be ignored by some of them with impunity, or overlooked by the assessor, who had a hand in drafting them. It is disappointing enough with the usual kind of buildings; it is little short of heartbreaking when the problem to be solved is so pregnant with fine possibilities. To revert to this particular instance. had the Building Committee sought an architect, or, better still, a jury of three architects known, beside their integrity, for their independence of judgment and ability to scrutinise planning and æsthetic considerations, it would have saved itself much of the doubt bound to creep in as reflection operates, and saved most competitors from the paralysing mistrustfulness engendered by unsatisfactory assessing.

THOS. S. TAIT.
GORDON H. G. HOLT.
VERNER O. REES.

"Charlatans and Pests."

SIR,—A medical student, alleged to have practised as a doctor before he had passed his final examination, has recently been denounced by the Woolwich coroner as a "charlatan and a pest." Had such a man chosen to practise as an architect he could have duped the public to his heart's content, without hindrance from the professional organisations or anyone else.

If a "charlatan" is to be defined as a man who practises a profession in which he has passed neither qualifying examination nor received recognised training, then the number of "charlatan architects" must be large, as it is an acknowledged fact that the majority of plans passed by borough and urban councils are prepared by men who have no recognised qualifications.

At present most local authorities employ men as engineers, medical officers, accountants and sanitary inspectors, who hold the recognised qualifications of their respective callings. The architectural department, however, has, in the majority of cases, no qualified chief, but is merely a side line to the duties of the engineer.

The letters "A.R.I.B.A." and "M.S.A." convey little to the man-in-the-street, and any others, such as "X.Y.Z.," would, to many, convey as much. Recent enquiries were made from several people as to what professions "A.R.I.B.A." and "M.S.A." belong, and, not knowing, the guesses were associated with accountancy. Yet "F.I.A." was no "poser" at all owing to the letters continually appearing in the advertisement columns. Auctioneers may advertise, estate agents always advertise, and all these may practise as architects. The architect who is fortunate (*sic*) enough to be a member of either the Royal Institute or the Society may not advertise, neither is he supposed to act as an estate agent, auctioneer or business broker; he is, therefore, competing on most unequal terms with others, being unable to practise in their callings yet being trampled on by them in his own.
